BIENNIAL REPORT

OF THE

BOARD OF HEALTH

FOR THE

TWO YEARS ENDING JUNE 30, 1900.

SAN FRANCISCO, June 30th, 1900.

To the Honorable James D. Phelan, Mayor,

Of the City and County of San Francisco—

DEAR SIR: I transmit you herewith the Annual Report of the Department of Public Health for the fiscal year ending June 30th, 1900. This Report comprises full data from the various institutions under control of the Board of Health, to-wit: the Health Office, the City and County Hospital, the City and County Almshouse, the Emergency Hospitals and Hospital for the Detention of the Insane, the Twenty-sixth Street Hospital and the Smallpox Hospital.

The reports from these different divisions of this Department contain very accurate and detailed statistical tables which have been prepared with great care.

Accompanying the Report for the fiscal year just closed is the Annual Report for the preceding fiscal year, which had been left in an incompleted condition by the last administration in the Health Office. This latter Report has received the same attention with regard to correctness of detail as that referred to above.

It is a matter of regret that the Board of Health on assuming office in January last found the department badly crippled owing to the insufficient appropriation granted its predecessors who during their brief term of office had conducted affairs in the Health Office, the Bureau of Food Inspection, the Laboratories and other branches with a full complement of employees. The large sums expended for salaries and other expenses had almost entirely consumed within the first half of the fiscal year the full amount set apart for the year.

The amount granted to the Board of Health which retired from office January 8, 1900, was \$46,960.00 for the fiscal year ending June 30, 1900. The records show that this sum was overdrawn to the ex-

tent of \$1,257.98 at the expiration of the first six months. The fund of the department being bankrupt, the Board of Supervisors was requested by the present Board of Health to appropriate sufficient money for the conduct of the Health Office and Emergency Hospitals during the remainder of the year. On March 12, 1900, the Board of Supervisors relieved the stringency to the amount of \$24,000.00, which was the limitation of the sum that in their opinion would suffice for the necessities of this department for the period specified.

As a result of this small appropriation the Board of Health found it necessary to inaugurate radical methods of economy. The Health Officer, the Secretary, the major portion of the clerical force, the Sanitary, Plumbing and Food Corps, the Chemist and Bacteriologist were all stricken from the salary roll, thus reducing the amount of expenditure for the services of employees to the minimum figures of \$802.50 in March and \$1,675 in April.

The officers and employees who were deprived of their salaries immediately volunteered their services gratuitously, and during their period of suspension performed their duties with assiduity and painstaking fidelity, thus enabling the department to continue in certain lines of work which otherwise would have been abandoned. This action on the part of the attaches permitted the department to effect such a saving that by degrees those who had been removed were restored to the payroll.

The administration of the present Board of Health has been marked by the occurrence of certain incidents which have unfortunately brought upon the members an excessive amount of virulent press criticism. The members of the Board, in strict pursuance of the duty devolving upon them as conservators of the sanitary interests of the City, have been subjected to violent opposition. This opposition may be traced to an early animosity manifested by the press to the entire City Government under present auspices. The continual attacks directed against the Board in the editorial and news columns of some of the papers of this City have been successful in molding the opinion of a large percentage of the public into one of pronounced and aggressive enmity toward the Board as a body and toward its members as individuals.

The main factor in producing this intensity of feeling was the discovery on March 6th of the present year of a case of bubonic plague in the Chinese quarter. With the co-operation of the Police Department a cordon was placed around the infected district and a quarantine declared until a rapid inspection could be made for the purpose of ascertaining if other cases of the same disease were in existence. This action called forth a storm of protestation on the

part of sundry newspapers, which declared that the entire proceeding was a political one, having for its object the creation of positions for administration favorites and the systematic looting of the City Treasury. Five days later the quarantine was lifted, as inspection failed to discover any living cases of disease which would warrant the continuance of the embargo

Three more bodies of Chinese dying of the same disease were found on the following dates: March 15th, 17th and 18th. On April 24th another case was found. In the month of May two cases were found on the 11th. On the 13th a case died at the Pacific Hospital, northeast corner of Stockton and Chestnut street, presumably of typhoid fever. Autopsy revealed the evidences of plague, and inquiry showed that the patient had resided at 730½ Commercial street in the Chinese quarter. Two more cases were discovered in the same month, on the 14th and 29th respectively.

In June two cases were found, one on the 2d, the other on the 9th, both Chinese residents of the Chinese quarter.

All the cases above enumerated were verified by animal inoculation, the experiments and investigations being conducted by the Bacteriologist of this department, by the Federal Quarantine Officer and by the Bacteriologist of the State Board of Health. The findings in every case were also examined and indorsed by several members of the Board of Health of Honolulu and by members of the faculties of Cooper Medical College and the Medical Department of the University of California, as well as by several other independent observers.

When the quarantine was lifted early in March, the Board of Health found itself seriously embarrassed in its intention to inspect and disinfect the Chinese quarter. An appeal was made to the Mayor and the gravity of the situation was explained. On March 20th a conference was held with the Finance Committee of the Board of Supervisors, consisting of Messrs. Jennings, Tobin and Hotaling. There were also present at this meeting the Mayor, the chairman of the Committee on Hospitals and Health, the Auditor and several members of the Board of Health. After hearing the statement of the facts, the Finance Committee, with the approval of the Auditor, instructed the Board of Health to the effect that \$7,500 would be allowed for the inspection and cleansing of Chinatown.

On March 22d a large force of men, twenty-five being physicians, was placed at work in the Chinese quarter under the direction of the Chief Sanitary Inspector. This inspection continued till April 7th. During this period every habitation and place of business in Chinatown was inspected. The sewers were flushed daily and

drenched with disinfecting solutions. The thoroughfares were cleared of accumulated garbage and tons of chloride of lime deposited in streets, yards and unsanitary places. All occupants of residences in the district were compelled to place their premises in cleanly condition, with the result that at the close of the inspection the sanitation was vastly improved.

The occurrence of several cases of plague in the early part of May caused the Board of Health to determine upon more stringent precautions than those heretofore employed. In accordance with a resolution adopted May 11th, employees of this department, acting with the assistance and advice of the Board of Public Works, commenced a systematic destruction of rats in the infected district and a considerable area thereto adjacent. Large quantities of poisoned fish were placed as bait in the sewers, which were screened as a preliminary measure. This resulted in the killing of a great number of the rodents, which are recognized as being active agents in the dissemination of the plague. The recommendation had been made by the Marine Hospital Service that inoculation with the Haffkine Prophylactic should be proffered to all Asiatics and others who might possibly be exposed to contagion. As a preliminary to the inauguration of this step a conference was held at the headquarters of the Chinese Six Companies, there being present many prominent Chinese merchants, the Consul-General, Ho Yow, Mr. J. E. Bennett, representing Chinese interests, several members of the Merchants' Association, Dr. J. M. Gassaway of the United States Marine Hospital Service, the members of the Board of Health and the Health Mr. Bennett opened the discussion by stating to the Chinese that plague existed in the City and that all cases so far found had been among Chinese. He explained the intentions of the Board of Health and further quoted a dispatch from the Chinese Minister at Washington asking the people of his race in San Francisco to aid the health authorities in preventing the spread of the disease. Short addresses were delivered by Dr. Gassaway, Mr. E. B. Pond, the Health Officials and others. At the conclusion of the conference the Chinese present promised their hearty support and asked that inoculation be commenced without delay.

On the following day, May 21st, a corps of sanitary inspectors and other medical men accompanied by assistants went into the Chinese quarter and offered voluntarily inoculation to all who cared to accept. Strong resistance was offered and with very few exceptions the Chinese refused to avail themselves of the opportunity offered. The reason of this revulsion of feeling was the circulation of inflammatory bulletins printed in the Chinese language and setting forth statements that the Board of Health had conspired with

the Chinese Consul-General to bring about the annihilation of all Mongolians in the City by the hypodermic injection of deadly poison. This slander was implicitly believed by the ignorant classes, who attacked our inspectors, mobbed the Consulate and forced the closing of all stores situated in the district. Realizing that it would be useless to attempt to carry out the proposed inoculation against superstition and mob violence, the effort to immunize the Chinese against plague was abandoned.

At this time, however, Dr. Kinyoun, Federal Quarantine Officer, acting under the advice of the Surgeon-General of the Marine Hospital Service, notified transportation companies to refuse to sell tickets to Asiatics intending to leave San Francisco unless said Asiatics presented certificates of inoculation. This order was promptly obeyed, and officers of the Marine Hospital Service and of this department were stationed at various points of exit from the City for the purpose of inoculating Chinese and Japanese who desired to submit to the prescribed conditions. So intense was the opposition to this measure that those Chinese who did submit were in danger of forfeiting their lives through the violence offered them by their countrymen. The Japanese as a rule exhibited intelligence and except through a formal protest by their Consul displayed no antagonism to the order.

In the meantime the right of the Board of Health and the Marine Hospital Service to enforce compulsory inoculation was carried into the United States Circuit Court. A restraining order was issued until a decision could be rendered. On May 28th Judge W. W. Morrow decided that the actions of the Federal Officers and the Board of Health were illegal and showed discrimination against Chinese and Japanese. The Court also held that the Board of Health, not being vested with legislative functions, had not the power to declare a quarantine. The defendants in the case at issue bowed to the decision of the Court and inoculation was no longer enforced.

On May 28th the State Board of Health held a meeting at the Grand Hotel in this City. The question of the presence of plague was thoroughly discussed and at the close of the session the Board officially determined to demand a quarantine of the Chinese quarter by the Board of Health of this City. Communication to this effect was immediately transmitted to the Health Office, and on the evening of the same day the Board of Health convened. A large number of representative business men were present and were emphatic in their endorsement of the request of the State Board.

On the following day the Board of Supervisors held a special meeting to consider the request of the Board of Health for authorization to establish a quarantine. Prompt action was taken and

a resolution passed empowering this Board to proceed at once in the placing of a cordon about the infected district. At 3 P. M. of the same day the quarantine went into effect.

The United States Circuit Court became again the scene of a contest as to te right of the Board of Health to maintain this quarantine. On June 15th a decision was rendered denying the right of the Board to quarantine a district. Upon receipt of this information the cordon was at once removed.

While this quarantine was in effect valuable assistance was afforded the Health Department by the formation of the Citizens' Relief Committee, which was organized at the rooms of the Board of Trade, June 1st. At this meeting nearly \$30,000 were subscribed to be expended under the direction of proper committees for such measures as the United States Marine Hospital Service and the Board of Health might see fit to employ for the safeguarding of the community. A garbage crematory was erected on the edge of the quarantined area, and refuse accumulating within the lines was promptly destroyed. Steam sterilizers loaned by the Marine Hospital Service were placed in Portsmouth Square, and the clothing of employees of the department on duty in the district thoroughly disinfected. Large quantities of sulphur were burnt and the sewers filled with the vapor, while other disinfectants were freely used throughout the district.

Throughout this entire period of quarantine much resistance was offered on the part of the Chinese, and the work of the representatives of the Health Department badly hampered. Such of the Chinese as showed a willingness to facilitate inspection were terrorized by their countrymen, and the assistance of the police was frequently required to quell disturbances. This belligerent attitude assumed by the residents of the quarantined district was fostered and encouraged by the advice of attorneys and the malicious reports of certain of the local press.

Upon the removal of the quarantine, the Citizens' Relief Committee notified the Board of Health that it would not be responsible for any further expense. This was modified to the extent of providing for the continuance of the garbage crematory until all garbage accumulated had been consumed, but within a few days the furnace was wrecked by some inscreant or miscreants whose identity has never keen established. This latter act of vandalism amply illustrates the difficulty with which this Board has had to contend in every move it has undertaken to improve the sanitation of the City. So far has this spirit of antagonism permeated the community that it has even extended into official circles. On June 19th the Hon. W. N. McCarthy, a member of the Board of Supervisors, introduced into that body a resolution setting forth a statement that

the Board of Health was composed of men who were not competent to recognize bubonic plague, that the statements made by the Board of Health urging a quarantine of the Chinese quarter were malicious and false, that the Board of Health had no longer support and confidence of the Board of Supervisors and by reason of the foregoing the Mayor was earnestly requested to declare vacant the offices of its members.

During the months of May and June the Hon. Henry T. Gage, Governor of the State of California, was reported in the daily press as conducting an investigation to ascertain the truth or untruth of the statements made by this Board as to the existence of plague in San Francisco. This investigation was carried on in an ex-parte manner, and no information was sought or procured from the records of the Health Department of this City. On June 13th the Governor issued a letter addressed to the Honorable Secretary of State of the United States, wherein he officially denied that plague at that time existed or had ever existed within the borders of our State. This opinion was concurred in by certain prominent physicians, who had not derived their information from the records of the Health Office, and by certain well-known bankers and merchants who evidently accepted the findings of the Governor without giving due consideration to the actual facts.

The effect of the Governor's message upon the community was the production of a feeling of false security which was not justified by the true conditions. The attacks against the Board of Health were redoubled and every obstruction possible placed in the way to prevent the performance of its duty. Realizing the utter impossibility of being truthfully represented to the public through the columns of any San Francisco daily papers, the Examiner and Report excepted, the members of this Board did not attempt to reply to the scurrility and mendacity which constituted the bulk of the information concerning the Health Department doled out with unfailing regularity by the daily and weekly journals published in this Under all the adverse circumstances above set forth, the efforts of the Board and its officers have not been relaxed and so far as possible the work has been carried on with the single intention of protecting the health of the municipality. It is the belief of the members that time will produce the vindication which is due, and which has already been privately conceded by many who have not the courage of their convictions to express their opinions publicly.

Further comment on the subject of bubonic plague is at present writing unnecessary, but it will not be amiss to state that the investigations by this department have not been conducted solely by

its own representatives. The findings which have caused so much bitter criticism and false accusation have been examined and participated in by others absolutely removed from any suspicion of interest in either side of the controversy. Among them can be mentioned Drs. Raymond, Cooper, Day and Hoffman of Honolulu, all of whom were familiar with the disease in question from having observed it during its recent activity in their own community, and all of whom concurred in the reports presented by the Bacteriologist of this department relative to the cases investigated in San Francisco.

In conclusion, I will simply draw attention to the fact that the institutions operated under the supervision of this department show satisfactory progress, and are not being neglected by reason of the ungent matters which have recently concerned the Board. Reference to the reports presented by the officers in charge will show the character of work which is being accomplished. A word must be said regarding the deplorable condition of the Twenty-sixth Street Hospital and the necessity for improvement therein. This hospital and the Smallpox Hospital should be demolished and new structures erected where those persons who are so unfortunate as to need their shelter may be housed and cared for in a manner consistent with common humanity. Your assistance in bringing about this muchneeded reform is earnestly requested.

Respectfully submitted,

JOHN M. WILLIAMSON, M. D.,

President Board of Health.

HEALTH OFFICER'S REPORT

FOR THE

FISCAL YEAR ENDING JUNE 30, 1900.

SAN FRANCISCO, June 30, 1900.

To the Honorable the Board of Health, City and County of San Francisco—

GENTLEMEN: In making my report for the fiscal year ending June 30, 1900, I feel that, in order to properly place the work and improvements made in the Department of Public Health for the City and County of San Francisco, it is absolutely necesary for me to give you a slight resume of all the happenings in the department from the year 1895. At that time the Health Department was in a deplorable condition, owing to the fact that the City had outgrown in a vast degree the appropriation set aside for sanitary work, the sum total being \$26,000 allowed by the Board of Supervisors, and this sum computed on conditions as they existed twenty-five or more years ago. Seeing the necessity of more money for the maintenance of a proper sanitary department, the Board appealed, and successfully, to the Board of Supervisors for an increase in appropriation, and were generously assisted by the different commercial associations, the Chamber of Commerce, Regent Reinstein of the University of California and others, the result being that the sum of \$65,000 was appropriated. With this sum of money at their disposal it was thought advisable to create other departments for the greater efficiency of the service, to-wit: A Public Vaccinator, Milk Inspector, Veterinary Surgeon and Bacteriologist. An Ordinance regulating the quality of milk supplied to the City was submitted to the Board of Supervisors and officially adopted by that body. Milk and dairy inspection were at once inaugurated and the effect was a marked improvement in both dairy and herds. The reduction of infant mortality the following year was almost 50 per cent.

The corps of Health Inspectors was increased by two, in order to better inspect the houses of the City.

An Inspector of Bakeries was appointed, the good judgment of which was demonstrated in the correction of the filthy methods and surroundings in the bake-shops.

Two Bath and Laundry Inspectors were appointed and every laundry in the City inspected and thoroughly renovated, and in every instance the department insisted that cement floors be laid in the washrooms and in addition an Ordinance was adopted prohibiting the employees of Chinese laundries from spraying the clothes by means of water emitted from the mouth.

Owing to the extreme conditions in Chinatown and in the Latin Quarter, two additional Plumbing Inspectors were appointed, and their work, now a record in this department, shows the wisdom of this policy.

With the increased appropriation two Laboratories, one for the examination of foodstuffs and the other for bacteriological research, were established. A Chemist and assistant were placed in charge of the Chemical Department, in which they have since been kept busy analyzing food samples, water supplies of the City and illuminating gas.

The Bacteriological Department has afforded the physicians throughout the City the service of the Bacteriologist for the verification of diagnosis of diphtheria, and sterilized swabs are constantly being prepared for the culture of the Klebs-Loeffler bacilli. The same facility is extended for typhoid fever and other researches. Last year the report contained voluminous description of the distribution of free anti-toxin to the poor of this City and the regulations governing it. The results are proven by a glance at the charts in that report. The vast amount of service done in the Food Department are familiar to the public and it has learned to appreciate good milk. We also feel that the brands of condensed milk, honeys, jellies, catsups, etc., are to-day, owing to the crusade, superior to the article formerly vended. Fines and publicity have in some instances driven the dishonest dealers out of trade.

That the work has been appreciated by the public is evidenced by the fact that in the latter part of 1897 the Supervisors generously raised the appropriation to \$80,000. This shows that the department undoubtedly had gained the good will and approval of both the public and officials of this City. During the next fiscal year \$85,000 was appropriated and the good work continued.

The major portion of 1898 found me absent, having tendered my services as surgeon in the United States Army in the Philippines, but my place was filled, even better than I could have filled it, by my friend Dr. John Gallwey, who kindly assumed the duties for me during my absence. During this period his responsibility was greatly increased by the presence of so many thousands of troops, who necessarily, owing to the unhygienic condition of their camps, were a great menace to the health of the City. He did his work

faithfully and well, as is clearly apparent by a glance at the slight increase in the death rate under the circumstances and in the face of the difficulties suddenly thrust on him by the presence of the volunteer camps. These camps were proven beyond a doubt, by the sickness among the troops, to be a hotbed of disease. That he handled this great problem skillfully is proved, as I said before, by the statistics of the department and by the manuscript, page after page of correspondence found by me on my return, which was carried on between the army authorities and the Health Officer. After persistent efforts on Dr. Gallwey's part the former were finally educated to the fact that they must recognize local law of this department and establish their camps in conformity with the health regulations of this City. Referring to the military camps, we are reminded that typhoid fever was one of the prevailing diseases among the troops, and as we cannot be too careful in the prevention of the spread of this disease and while all physicians have for years been careful in disinfecting the stools of typhoid patients, I recall another source of infection, and probably a greater one, which is generally overlooked. I refer to the urine of the sick, which science has proven conclusively in the last few years contains typhoid bacilli, and probably not once in ten years is it disinfected, so you can readily appreciate how much good a circular to physicians calling their attention to this fact would do.

In February, 1898, the fact that San Francisco had no Pesthouse, of which your Board has been preaching and appealing for in the last four years, was suddenly thrust upon the public by the presence in your midst of smallpox, and I am happy to say that the Hon. Mr. Holland, Supervisor, took the bit in his teeth and, with the assistance of his Honor, Mayor Phelan, who has always been a friend of this department, succeeded in getting a sufficient appropriation for the erecting of proper shelter for those afflicted.

As I was not in office from June, 1899, to January, 1900, I am not familiar with the work of the department during this period, except as I have learned it from the reports of record in the department, and the same you will find embodied in this year's annual.

On January 8th, 1900, the present Board of Health assumed duties under the new regime, that is, the Charter Government of the City and County of San Francisco. It being a new era, many difficulties opposed the Board in the workings of this department, and it was some time before things were running as smoothly as they should.

The placing of a medical man in charge of the Food Department and the Sanitary Inspection Department has been conducive of a greater amount of efficiency than has ever existed heretofore, and as well has the work of the Sanitary Inspectors been raised to an extremely high standard by the presence there of a corps of professional men. As you are well aware, the late unpleasantness in the Chinese district, owing to the presence there of Asiatic plague, has placed additional difficulties before us. Unscrupulous physicians have succeeded to a very great extent in causing the public to disbelieve the honest statements of your Honorable Body that a great danger threatened the fair City of San Francisco, but truth is mighty and we have gone along fearlessly performing our duty irrespective of any criticism from press or public, and I think have accomplished more in a sanitary direction for the betterment of certain districts in this City than has ever heretofore been accomplished.

It is to be hoped that under the new order of things your Honorable Board shall have succeeded in formulating rules and regulations for the government of the Department of Public Health, and when the same has been passed to Ordinances by the Honorable Board of Supervisors the City and County of San Francisco will be then in possession of a sanitary code equal to any now extant in either this country or Europe.

It is very greatly to be deplored that owing to the financial stringency resulting from the sudden change of form of government in this City, our department was obliged to reduce the expenses of some of the most necessary bureaus, chief of which was that of the Chemical Laboratory, wherein it became necessary to deprive Professor Green of his assistant. This branch of the service has in the past performed such specifically splendid work in the long train of investigations embracing milk and foodstuffs that it seems a great hardship that the people of San Francisco should not, as is the casē at the present time, be properly protected from the adulteration of foodstuffs. I sincerely hope that in the near future this necessity will be made so apparent that the Supervisors will recognize it and appropriate sufficient money for the enlargement of the Chemical Laboratory.

Many other curtailments have been necessary as well, prominent among which is the reduction of the sanitary force, food inspection force, and I will add that great good might have been accomplished had your Honorable Board money sufficient at its disposal for the enlargement of the Plumbing Department, who handle on an average some sixteen hundred complaints a month.

Respectfully submitted,

A. P. O'BRIEN.

Health Officer.

United States Weather Bureau, San Francisco, Cal.

REPORT OF THE CHIEF SANITARY INSPECTOR.

San Francisco, July 1, 1900.

To the Honorable the Board of Health;

Of the City and County of San Francisco-

Gentlemen: In submitting this annual report for the fiscal year commencing July 1, 1899, ending June 30, 1900, I am confronted with difficulties of such a character as to impair a full and comprehensive resume of the year's work, applying to the intention and work of the Board of Health.

The intention of the department has been to exert all efforts to improve the general sanitary condition of the city, prevent the sale or exposing for sale of diseased meat, to guard against unscrupulous dealers adulterating food stuffs, to search for and confiscate articles of food in the market that are not standard, all of which may be the cause of introducing disease, and affecting the health of innocent purchasers and consumers.

The Board of Health has placed under the Chief Sanitary Inspector the supervision of inspection of the Sanitary, Food, Market, Bath and Laundry, and the Fumigating Departments.

Whatever may have been accomplished to comply with the recommendable intention of the Board of Health has been greatly embarrassed by a lack of sufficient assistance from the Board of Supervisors, in whose power was vested the legal authority and obligation to give the necessary assistance financially, whereby a sufficient number of inspectors could have been employed to carry on a proper system of inspection. Instead, we have been crippled by an inefficient number in the force.

At the commencement of the year we had 10 Sanitary Inspectors, 10 Food Inspectors, 6 Market Inspectors, 1 Laundry Inspector and 1 Bakery Inspector.

With this force in operation in these various departments we could by exertion partly accomplish what San Francisco would require, but in the months of March and April we were forced to reduce the different departments—the Sanitary and Food Departments to one-half, and combine the Laundry and Bakery.

Previous to this change, I particularly wish to insert in this report the willingness of the Inspectors to aid the impoverished condition of the city by their offering their services and labor gratuitously for the months of April and May, awaiting the help they expected from the Board of Supervisors, which body later showed its ingratitude by not recognizing the appeal of the Board of Health to recompense the various departments by creating funds to be apportioned by the future conducting of the departments.

I will, in order to more clearly explain some of the obstacles we were forced toovercome, take each department separately.

The ten Sanitary Inspectors were detailed to five districts, extending from the water front to the San Mateo County line, two in each district, whose duties were to examine violations of sanitary regulations complained of and filed in the Health Office, search their respective districts for such violations, and cause their abatement.

Much good was accomplished, as has been attested by the abatement of 1,669 nulsances, and referring to other departments, chiefly the Plumbing Department, of 2,248 complaints, all tending to nurse and propagate the germs of contagious diseases. One great result, prominently to be mentioned, refers to the scavenger Industry. Scavengers were in the habit of dumping their collection of filth and garbage in vacant lots and on the public streets during the night hours, to avoid observation, in all parts of the city, and patrolling the streets, in their business of collecting garbage, with unlined, filthy, ill-smelling, leaking wagons. This has been checked by the active efforts of the Sanltary Inspectors, who have devoted nights after their daily work to watch the evasive scavengers attempting to dump their collection of garbage in public places. Their vigilance has caused many arrests and a corresponding number of convictions, which has had its good effect in forcing all garbage to reach its proper and assigned destination for cremation. This work was interrupted in March, April and June. While these Inspectors were offering their services gratuitously, on account of lack of funds, they were ordered to Chinatown, to meet the disagreeable, and I emphatically add DAN-GEROUS, work necessary in that district, the most degraded, filthy, immoral and unsanitary location within the boundaries of the United States of America, to which I will hereafter refer.

It required the entire inspecting force to meet the order for a house-to-house inspection, which left the remaining districts unprotected by daily inspection, which I deem a necessity.

In June, 1900, this department was again crippled by a compulsory reduction in the number of Inspectors, reducing the number to five, in order to meet the impoverished condition of the treasury, the unreasonable whimperings of a fossilized part of the public, the partisan press, and the neglect of the legislative body, the Board of Supervisors, to give us their assistance. This reduction is to be operative for the ensuing fiscal year, namely, twelve months.

I will allow the reader who may be a father, a mother, or a public-spirited citizen, to conclude if five Sanitary Inspectors make a sufficient sanitary corps to daily watch for and correct sanitary violations in a seaport city of an estimated population of 450,000.

The Food Inspectors, numbering ten, charged with the duties of suppressing the sale of adulterated foods and milk, have also been crippled after the discovery of bubonic plague in Chinatown. They were detailed to give assistance to the Sanitary Inspectors in their house-to-house inspection, again being compelled to leave their respective districts open to violators of pure food ordinances.

As a compliment to this department, I call attention to the fact that their services were offered and furnished gratuitously, on account of lack of funds in the city treasury. For this the people of San Francisco owe them a debt of grattude, and the Board of Supervisors a reprimand for denying them adequate relief by officially declining to render them their financial assistance. This interruption in their particular line of duty deprived me of their help in examining the milk supply given the public of San Francisco, and for this reason milk inspection was not attempted during the last six months of the fiscal year, where I had good reason to believe much of the milk sold was diluted and deleterious.

The Market Inspectors, numbering six, have been districted so as to examine all slaughtered meat, and all poultry arriving in the city at the ferries, railroad entrances and other inlets; also, the supervision of the slaughtering within the city, and an examination of retail market places, as well as the fish markets.

Again this department offered its services gratuitously to meet that disgraceful condition into which the City of San Francisco had allowed itself to lapse—a lack of funds to remunerate its servants—and where could money be better used than to protect the people from diseased food being used for daily consumption.

Attention is particularly called to the number of pounds of condemned beef, to

which may be added other articles. This is due to condemnation of supplies in the United States Departments of Army and Navy. While condemned by the United States authorities, they have been offered at public auction to private purchasers, ostensibly for fertilizing purposes, but were actually, in many instances, purchased for repacking. Many articles, while condemned by the United States Board of Survey, were good and marketable, while others, particularly beef and pork, were spoiled, and still sold, where they should have been destroyed. I followed the principle in condemnation that articles condemned by the United States as unfit for army or navy consumption were unfit for local consumption.

Many tents, mattresses, blankets, etc., were also placed on the market at public auction, having been exposed to contaglous disease, without a certificate of fumigation. This has caused a great amount of extra work on your Sanitary force, but I believe much danger has been averted.

I wish to attach to this report a few remarks regarding Chinatown, by which I may sum up the entire situation in the following words:

Chinatown to-day is a menace to public health, to public morals, and to public decency.

In this classification, as Chief Sanitary Inspector I might properly confine myself to the first division, Chinatown as a menace to public health, but the fact exists that the violation of public morals indirectly bears an influence on the health of an unfortunate class frequenting the district. I openly make this statement, and I trust the proper authorities will investigate Chinatown morally, and such information as I possess will be willingly offered.

When the attention of your Chief Sanitary Inspector was directed to Chinatown I personally entered the district to determine the necessity of an investigation, and, if necessary, the plan of procedure.

I found Chinatown imperatively in need of immediate relief. It is a district populated by aliens, who differ in their customs, habits and ideas of sanitation from those approved by modern sanitarians. To advise, entreat, suggest, with them was a waste of time. They wanted no advice, would accept no suggestions. On the contrary, they repulsed my advances, interpreting my intention as dishonest, and solely for the purpose of extortion. They are a class of people never ready to comply with suggestions or requests made in good faith and for their welfare, but always walting until suggestions by necessity are changed to compulsory edicts. The attention of the Board of Health was directed to this quarter, and, almost immediately following such recommendations as I deemed advisable, arose the appalling discovery of the fact that Chinatown harbored the germs of bubonic plague, and I will at this point offer my conviction, and I believe it well founded, had existed and caused deaths eighteen months previous to its detection in March, 1900. This caused for closer observation, resulting in discovering an area inhabited by approximately 30,000 people, closely confined, existing in open defiance of all sanitary requirements and ordinances, through which territory public highways permitted Caucasian travel and public traffic constantly carried by streat cars to all parts of San Francisco. The very few places in this district that could possibly be passed on as sanitary were in such immediate proximity to unsanitary surroundings that I can without hesitation conscientiously declare It my belief that the district known as Chinatown is in an unsanitary condition, and I will briefly state the reasons for my declaration:

First-There is a general defective plumbing.

Second—There is a disregard to disposing of garbage, allowing accumulation. Third—There is a prominently absolute disregard for the cubic-air ordinance.

Fourth—The overflow from the permanently located inhabitants nearly all seek underground lodging places, where, in the majority of cases, there is total dark-

ness, dampness, obnoxious odors, and absolutely no ventilation otherwise than the door or entrance.

Fifth-There is always an intention on the part of the Chinese to conceal sickness and deaths.

Sixth—The disposition of the Chinese to cast aside their unfortunate and indigent sick, whom, after being pronounced incurable by Chinese physicians, they were in the habit of placing in Chinese undertaking establishments, on hard cots, within a few feet of an open coffin, conveniently placed there to await the death of its prospective occupant.

Seventh-A general repugnance to co-operate with the health requirements.

To correct this, I have previously recommended certain remedies tending to abate the existing evils, which have met with the approval not only of the Health authorities, but other departments of the city government, prominently the Board of Fublic Works and the Police Department. Generally speaking, I again recommend that all streets and alleys within the district be covered with bituminous rock where the grade will permit the safe operation of trucks and teams. If this could be accomplished, it would be an easy matter to use the fire hydrants to wash the streets and alleys at any and all times, ordinarily with water, or with disinfectants, if deemed necessary.

Further, that all underground lodging places be condemned as unsanitary and unfit for human habitation, as they are but receptacles for the accumulation of filth and incubators of disease. Many of these places frequented are inhabited by Chinese and Japanese, who are servants employed in white families throughout the city. Others are small manufacturing places, where clothing, clgars and home necessities are prepared for the public market.

Further, the plumbing of the entire district should be corrected to conform with the requirements that are enforced upon the white population of the city. Many places have only soil and waste pipes leading to an open sewer, without any traps, and in certain alleys the water closets actually protrude on the streets, and are blocked by accumulation of human excrements.

Further, the condemnation of buildings, sheds and partitions as the Board of Health may determine unsafe and unsanitary. This last suggestion I believe would accomplish more towards a general improvement in sanitation than any other action that might be undertaken.

The reader may pause, and with good reason ask: If such is the case, why does not the Board of Health take action?

Mr. Reader, my answer is that under the Charter the Board of Health has not been delegated the power. The Board of Supervisors is the legIslative body of San Francisco, and without their assistance in passing an ordinance governing these abuses and delegating power to the executive body, the Board of Health or its representatives called legally act. Your representatives are anxiously waiting and in readiness to be legally garbed, so that the abuses mentioned may be summarily corrected. In almost all attempts to improve Chinatown by your representatives we meet with potent opposition, a partisan press, a factional public opinion and the opposition of Caucasian property owners who derive an enormous revenue from tenants who allow sanitary violations to exist, and protect themselves against their abatement by resorting to a legal process, the much-abused writ of injunction. Respectfull: submitted,

W. S. CHALMERS, M. D., Chlef Sanitary Inspector.

W. P. CHALMERS, M. D.,
Chief Sanitary Inspector.

REPORT OF INSPECTOR OF BAKERIES, BATH HOUSES AND LAUNDRIES.

San Francisco, July 1, 1900.

To the Honorable the Board of Health Of the City and County of San Francisco—

Gentlemen: I herewith submit the following report of inspection of bakeries for the fiscal year ending June 30, 1900:

When I commenced making inspections of bakeries I found many in bad condition, some having black, dirty walls and ceilings, others bad floors or not sufficiently ventilated, but I am gratified to say that all the owners of bakeries that were notified to whitewash, to give ventilation or to make repairs have complied to the notices served.

I wish to call your attention to the way some of the bakers dress while making dough. All they wear is a pair of trousers, being naked from the waist up. In my opinion these men should not be allowed to make dough or bake without having their bodies covered, for some of them may have skin disorders.

Following is a synopsis of results of inspection of bakeries during the past year:

Total number of bakeries under inspection	240
Number of inspections from July 1, 1899, to July 1, 19001	,987
Number of nuisances abated	85
Number of bakeries referred to Plumbing Inspector	28
Number of nuisances unabated July 1, 1900	7

REPORT OF INSPECTION OF BATH HOUSES AND LAUNDRIES.

The following is a synopsis of results of inspection of bath houses and laundries for the fiscal year ending June 30, 1900.

I could not submit any remarks, having only been lately put in charge of this inspection.

Bath Houses-

Total number of bath houses under inspection
Bath houses found in good condition26
Bath houses found in bad condition 7
Laundries-
Total number of laundries under inspection
Number of inspections from July 1, 1899, to July 1, 19001,014
Number of laundries where work was done as ordered 111
Respectfully submitted,

AUG. BERGEZ,

Inspector of Bakeries, Bath Houses and Laundries.

CHEMIST'S REPORT.

SAN FRANCISCO, July 1, 1900.

To the Honorable the Board of Health

Of the City and County of San Francisco—

Gentlemen: I have the honor to submit summary of work carried out in the chemical laboratory for the fiscal year 1899-1900.

From July, 1899, to January, 1900, the chemical laboratory was in charge of my successor and predecessor. Culled from the monthly reports, I give tabulations of the work accomplished.

For the six months ending in July, 1900, 54 samples of milk have been analyzed, 33 being up to standard, 2 soured, leaving remainder below requirements. This shows about sixty-three per cent to be up to standard. This does not represent the condition of the milk supply of the city, for the reason these were not averaged from the city dairies.

· Eleven samples of candy were analyzed with a view to deleterious ingredients, with negative results.

Fourteen whisky and wine analyses were carried out, mainly to judge of the purity of samples submitted, also their relative values.

A toxicological examination of the shrimps from the Bay of San Francisco failed to reveal the presence of ptomaines or toxic bases.

Reports of the analyses of 31 honeys are tabulated. The strained honeys of this market are frequently compounded with cane sugar and glucose. Some honeys seem to be on the horderland of purity; those I have given the benefit of the doubt. A rigid interpretation of the analytical data would condemn them. In each instance, where the dealer's name was on the package the honey was pure. The standard of purity was arrived at by the examination of some comb honeys, which responded to all the accepted tests for purity. Work was done on California honeys, so as to be independent of data given by Eastern and foreign observers. As a result of the work, I find 16 pure honeys, 9 mixed with glucose and cane sugar and 6 doubtful.

Under the heading of "Miscellaneous," 41 analyses have been completed, with results as per table.

In all of the above-mentioned work I have been much aided by Mr. H. M. McQueen and later by Mr. C. A. Brandt. They occupied the position of Assistant Chemist at different times in the chemical laboratory.

Eight samples of condensed milk were partly analyzed, but were left incomplete owing to lack of laboratory help.

The laboratory is well equipped, barring electric power for chemical work and conveniences for filtration and evaporation in toxicological work. The work carried out by the toxicologist embraces 34 analyses for the Coroner and 15 for the Police Department. This is for a period of six months. Dr. Morgan's work appears in a separate summary, which follows.

As I have stated before, the chemical laboratory is very much in need of an assistant chemist, or better, assistant; chemists, in order to carry out the work outlined by the Department.

Yours, respectfully,

FRANK T. GREEN. Chemist.

ANALYSES.

RESULTS OF ANALYSES.

Polarization + 10.; adulterated with glucose.

Polarization O.; sample is pure honey.

Polarization O.; crystallizes; is pure honey.

Polarization O.; crystallizes; is pure honey

Polarization O.; crystallizes; sample is pure honey.

Polarization O.; crystallizes; sample is pure honey.

Sample is viscous crude opium.

Sample is saturated solution of chloral hydrate.

Does not contain organic or inorganic poisons.

Sample does not contain any poisonous compounds.

Sample contains mucous, epithelium and urates.

Sp. gr. 1030; Fat 3.5; Cream and Proteids normal.

Sp. gr. 1016; Butter Fat 12 per cent.; Formalin in traces.

Preservative used is Bicarbonate of Soda in large quantities.

Does not contain any preservatives.

Does not contain preservatives; no cause for complaint.

Sample is in process of fermentation.

Sample is not fermenting.

Sample is rancid, but pure Olive Oil.

Sample does not contain any poisonous substances.

Sample does not contain any preservatives.

Sample does not contain any preservatives.

For samples below standard see Chief Food Inspector's Report.

Sample is viscous crude opium.

Sample is same as No. 465.

Pure coffee.

Contains large quantities crystallized Copper Sulphate.

Sample is crude opium used for smoking.

Pure candy; does not contain any inorganic or organic poisonous substances.

ANALYSES.

RESULTS OF ANALYSES.

Does not contain fusel oil.

Does not contain any poisonous substance.

The sample is pure morphine.

Sample is butter, mixed with some foreign fatty substance; adulterated.

Sp. gr. 96; Butter Fat, 2 4-5 per cent.

Sample contains Formalin.

Sp. gr. 76; Fat, 2 2-10 per cent; Cream, 8 per cent.

Sp. gr. 96; Fat, 2 3-5 per cent; Cream, 7 per cent.

Sp. gr. 102; Fat 6 3-5 per cent.; Cream 14 per cent.

Sample contains Formalin.

Sample contains Formalin.

Sample contains sugar.

Sediment contains mucus, phosphates, oxalates and hyaline casts.

Sample is crude lump opium.

Sample is crude lump opium.

Sample is 99 per cent. pure cane sugar, same purity as sample submitted by bidder.

Sample is 99 per cent. pure cane sugar, same purity as sample submitted by bidder.

Found to be 99 per cent, pure cane sugar.

Colored with an analine dye, but does not contain either organic or inorganic polsonous compounds.

Consists of cocoa butter and boric acid.

Found sample to be pure morphine sulphate, weighing .7695 grams.

The slimy deposit is mucin.

The deposit consists of mucin and traces of earthy phosphates.

Found to be normal in every respect.

ANALYSES.

RESULTS OF ANALYSES.

Does not contain any poisonous organic or inorganic substances.

Sp. gr. 1030; Butter Fat 3 2-5 per cent.; total solids 13 9-10 per cent.; Cream 14 per cent.

Sp. gr. 1019; Butter Fat 1 4-5; total solids 14 per cent; Cream 1 4-5.

Milk does not contain boric acid, carbonate of soda, formalin nor salicylic acid. No cause for complaint.

Sp. gr. 1029; Butter Fat 5 1-5; Cream 16 per cent. Excellent milk.

Sp. gr. 1029; Butter Fat 3 1-5; Cream 8 per cent. No cause for complaint.

Found to be normal, but concentrated.

Does not contain chiccory, but is pure coffee.

Urine is normal.

Sediment consists of blood corpuscles and bladder epithelium.

Contains large quantities of salicylic acid, sugar, traces of alcohol, cinnamon and other extracts, and is colored with cochineal.

Sample is a saturated solution of chloral hydrate.

Sample is pure butter, but rancid. Cause for complaint.

Sample is pure butter, but rancid. Cause for complaint.

Sample does not contain any poisonous compounds, but is very rancid.

For number of samples below standard please see Chief Food Inspector's Report.

Butter Fat 1 3-5 per cent.; Sp. gr. 10.33; Cream 4 per cent.

Loss at 100 deg. C. 60.99 per cent; ,Fat, 25 per cent; Ash, 10.74 per cent. Sample is probably genuine cream adulterated with gélatine and preservatives.

Butter Fat 4 per cent.; good milk. No preservatives.

Sp. gr. 100. Butter Fat 4 per cent.; Cream 10 per cent. Good milk.

Sample is pure table cream,

Butter Fat 26 per cent. No preservatives. Pure cream.

Butter Fat 4 2.5 per cent. No adulterants or preservatives.

Butter Fat 2 3-5 per cent.

Butter Fat 4 per cent. Sample is good milk.

ANALYSES.		
	RESULTS OF ANALYSES.	

Coloring matter produced by barrel.

No ptomaines found in sample.

Sample is pure coffee.

Sample contains tin from interior of can.

For number of samples below standard see Chief Food Inspector's Report.

Contains per 100 parts, 78.36 per cent. water and volatile matter 18.48 per cent, organic solids, 3.16 per cent. ash.; starch is present in considerable quantity.

Not enough of solution remained for identification.

Chemical examination showed crystals to be morphine sulphate.

Chemical examination proved solution to be concentrated solution of hydro-cyanic acid.

The residue was found to be earthy phosphates. Sugar and triple phosphates were found present in large quantities.

Corresponds to Spring Valley water. Did not come from leak in sewer.

Not fresh nor fit for human food. Poisonous ptomaines were found in considerable quantity present.

Qualitatively did not show the presence of any injurious substances.

The residue consists of earthy phosphates. Sugar and triple phosphates present in large quantities.

REPORT OF THE BACTERIOLOGIST.

SAN FRANCISCO, July 1, 1900.

To the Honorable the Board of Health ${\it Of the City and County of San Francisco-}$

Gentlemen: I have the honor to submit the following report of work performed in the Bacterlological Department for the year ending July 1, 1900:

WATER SUPPLY.

The following report is the result obtained by a bacteriological examination of the water supplied by the Spring Valley Water Works to this City and County. The examination was made from samples which I obtained personally from all the sources of supply in Alameda, San Mateo and San Francisco Counties, and from various reservoirs within the City limits.

${f T}$ he	water	in	Lake San Andreas shows	1,876	colonies	per cc.		
"	**	**	Lake Piliarcitos (outlet) showe	1,640	44	44		
"	44	"	Lake Pllarcitos (deep) shows	1,380	4.4	**		
	**	•• '	Lake Pilarcitos (side flume) shows	1,130	**	44		
**	• •	"	Crystal Springs (shallow) shows	1,020	• •	**		
**	••	••	Crystal Springs (deep) shows	900	**	. 6		
**	• •	••	Lake Merced (below tunnel) shows	1,040	**	*4		
**	••	"	Lake Merced (deep) shows	280	• (**		
"	**	••	Niles Sub. Lake (dam) shows	38		**		
* *	**		Niles Sub. Lake shows	20	••	* *		
Water taken from reservoirs:								
College Hill from Lake San Andreas, shows					•	**		
Lake Honda from Lakes Pilarcitos and Merced, shows					**	4.4		
University Mound from Lake Crystal Springs, shows					**	* 6.		

With the exception of the Crystal Springs, the Merced and the Niles water, all show a disproportionately large number of colonies on the plate cultures. The presence of such a large number of bacteria is undoubtedly due to the decomposition of algae and other vegetation commonly found in water. These bacteria thus produced are not necessarily unhealthful. By a selective examination of the colonies no pathogenic bacteria could be found. This proves that the water is free from any poisonous contamination or sewage of any description. In all cases the water in the reservoirs contains fewer bacteria after being pumped and piped from the lakes. The screening and aerating processes used by the water company seems to improve the condition of the water. These beneficial effects are proven by the following table:

San Andreas	1,876	colonies	before	screening
**	1,640	4.1	after	4.4
College Hill	800	**	before	aerating
41 11	290	4.6	after	4.6
University Mound	480	**	before	screening
**	140	• •	after	44
Honda	600	4.6	before	**
**	230	4.4	after	**

Microscopic examination of the water disclosed several forms of small water insects which are absolutely harmless, and are generally caught by the screening.

Some of the work above tabulated, notably the water examination, was done by my predecessor in office.

The work of the Department has been greatly increased by reason of the appearance of a disease new to the United States, the Bubonic Plague, and it is likely that it will prove a source of trouble to us for many months, if not years, to come

It will be greatly to the interest of the Department of Health and the City of San Francisco if the Bacteriological Laboratory is enabled to progress in the acquirement of facilities to a degree commensurate with the growth of the City and increasing requirements exacted of the Laboratory by reason of the constantly increasing range of usefulness of laboratory methods to those who have the public hygiene in their care.

One thing which has been very noticeable during the past year is the infrequency with which physicians send in swabs from cases of diphtheria already diagnosed, for secondary examination, to determine when it is safe to release the patient from quarantine.

This is an important matter, for it undoubtedly happens that many children are allowed to return to school before they are perfectly well, while a bacterlo-logical examination might reveal the presence of virulent diphtheria bacilli in their throats. This persistence of the bacillus in convalescents is probably one reason why diphtheria is an endemic disease in our large cities. During the coming year I recommend the issuance of a circular letter to physicians, calling their attention to these facts, encouraging them to take more frequent advantage of their opportunities for a laboratory diagnosis, and requesting them to supply this department with information on their diphtheria cases, with especial reference to the use of anti-toxin. Blanks for this purpose can be printed and sent out with each swab.

I would also suggest that the medical inspectors, in the line of their duty, call on the physicians attending each case of diphtheria reported or examined bacteriologically, to receive any information they may be willing to impart, in relation especially to the use of anti-toxin. Another suggestion would be the establishment of stations at several drug stores in different parts of the City where physicians

can get the sterllized swabs for throat cases, glass slips in boxes for collecting blood for Widal examination, and sputum bottles.

The inspectors can call at the stations in their respective territories to gather up the specimens each day before coming in to report. This will enable the department to keep better informed on contagious diseases in the City, will increase the work of the department, and will be a great convenience to physicians.

DACTERIOLOGICAL DIAGNOSIS OF DIPHTHERIA.

The invitiod at present in vogue in this laboratory comprises the preparation of sterilized swabs, which consist of a small wad of cotton twisted onto the end of a wire, the other end of the wire being imbedded in the cotton plug of a six-lnch test tube. The whole is sterilized by dry heat, and is sent out accompanied by a blank to be filled out by the physician, giving the name, age and address of the patient, other persons in the family, duration of the disease, how contracted, and location of membrane, if any. These swabs are kept in the Secretary's office, and are called for and returned there by the physician. The swabs coming in during the day are Liought to the laboratory at 5 p. m., where tubes of Loffler's blood serum are inoculated with them, and placed in the thermostat at 37 degrees C. Little rum ering books are kept in the laboratory, with which to number each case. Each book consists of 100 leaves, numbered consecutively, each leaf being perforated into four parts, each part stamped with a number; the same number appears four times on each leaf. A leaf is torn out of the book, and one of its sections placed on the swab tube, one on the slip accompanying it, one on the serum culture, and the next morning the remaining one goes on the slide prepared from the culture. At nine o'clock the next morning the cultures are removed from the thermostat, and cover slip preparations made, stained with Loffler's methylene blue solution, and examined. The result is stamped on the slip accompanying the swab tube, which is filed. It is also recorded, with the name, etc., in the laboratory record, put on a daily report to the main office, and a blank filled out, to be mailed immediately to the physician.

EXAMINATIONS FOR BUBONIC PLAGUE.

It would seem as though the bacteriological diagnosis of bubonic plague had become a regular part of the work of this laboratory, and, as it is a disease with which we have not bac to reckon, previous to March, 1900, a brief account of the methods we have pursued to satisfy ourselves of its identity may not be uninteresting.

So far, with one or two exceptions, we have been unable to see any of the cases before death, only coming in contact with them by reason of the fact that they have all been members of our large Chinese colony, and have died unattended by regular physicians. Their great fear of the measures taken by the Board of Health to stamp out the disease leads them to conceal cases, and their fear of the disease, when they recognize it, impels them to neglect the sick.

In a few of the earlier cases, in which bubbes were prominent, we did not perform autopsies, but contented ourselves with a bacteriological examination of the contents of the bubbes. The reason for avoiding autopsies was that the superstitious and religious opposition of the Chinese to autopsies was such that we feared the concealment of bodies, if it was insisted upon. Later, however, their wishes were disregarded, and all cases autopsied. An account of these cases appears later on.

Smear preparations, stained preferably with one per cent thionin in five per cent carbolic acia, are prepared from the heart's blood, pericardial fluid, spleen and lymph nodes. Agar streaks are also made from these sources, and animals (guinea pigs and rats) are ineculated from the spleen and lymph nodes. After having

proved absolutely by methods to be detailed later that bubonic plague existed here, we have now settled down to the routine diagnosis of plague on the following information:

If the spleen and the enormously enlarged and necrosed lymph glands contain, in large numbers, a short, thick, bacillus, with rounded ends, bipolar staining, decolorizing by Gram, and the animals inoculated die of a hemorrhagic septicemia, and the same organism is found in myriads in the blood and spleen of the animal, then we consider it a case of plague. But, to be absolutely positive of our position in the matter, several of these cases have been taken, and every recorded bacteriological experiment performed with the cultures obtained from it and from the animals inoculated from it. Thus it has been found that the organism causing the death of these Chinese answers the following description:

A small, short, thick bacillus, with rounded ends, frequently occurring in pairs, and in agar and bouillon cultures in short chains. They are non motile and no spore formation was observed. Colonies on agar plates, in seventy-two hours at 35 deg. C., were .5 to 1 mm. In diameter, round, semi-translucent, with a blulsh or opalescent tinge. The surface is rounded, smooth and moist looking, and the consistency in older cultures tough and stringy. The bacillus was aerobic and facultative anaerobic and did not liquefy gelatine. It stains readily with the anilin dyes, commonly taking the stain more deeply at the ends, the so-called polar staining. This peculiarity was marked with carbo-fuchsin, but thionin seemed to give the most satisfactory results. In older cultures there were many swollen and rounded forms, which showed the bipolar staining in an exaggerated manner, causing them almost to have the appearance of little circles and cres-It is decolorized by Gram's method. Bouillon contained flocculent masses, was not clouded, and a film formed on the surface and settled downward in a fine cloud when the tube was jarred. Bouillon cultures answered to Widal's test with Yersin's serum in a most typical and satisfactory manner. Cultures were found to be pathogenic to rats, guinea pigs, monkeys and rabbits, but pigeons were immune. Twenty-four hour cultures on Hankin's 3 per cent. salt agar showed abundant involution forms. The postulates of Koch have been complied with to the letter. The following is an account of the cases up to the present date:

CASE NO. 1.

On March 6th, 1900, the Assistant City Physician reported to me the existence of a dead Chinese, with suspicious appearances, in the basement of the Globe Hotel, 1001 Dupont street. Accompanied by him I visited the place and removed the lymph nodes from a bubo in the right groin. The following is a history of the case:

Name, Wing Chit King, age 41 years; in Chinatown sixteen years; residence 1001 Dupont street. He stated to Wing Ging, his brother, that he had been sick for six months. On February 7th, 1900, he called at the office of Dr. Chung Bu Bing, complaining of headache, tired feeling, pain in head, back and chest, and fever; also symptoms of inflammation of the bladder. On February 14th he consulted Dr. Wong Wo about a lump on the right groin and was lame on that side. He was given a plaster to apply to the lump, but no surgery was done. A few days before his death he was taken with vomiting, profuse diarrhoea and collapse, followed by death.

The glands which were removed showed microscopically the presence of a germ resembling that of plague. The organism, as it appeared in the smear from the glands and stained with thionin, was very short and thick, with rounded ends. It took the stain deeper at the ends than in the middle, and decolorized by Gram's method. At this time the laboratory facilities at the City Hall were not of a character or kind to keep animals inoculated with material suspected of plague, and on consultation with Dr. Kinyoun arrangements were made by which

animals could be kept in his laboratory after they were inoculated with suspected materials. Accordingly, on the afternoon of March 7th, I visited the quarantine station, and there, with the assistance of Dr. Kinyoun and Dr. Agnes Walker, inoculated two guinea pigs, a white rat and a monkey with an emulsion made from the glandular tissue. Previous to these inoculations cultures were made on agar and blood serum directly from the glands and immediately after their removal from the cadaver. The guinea pigs and rat died on the fourth day after inoculation. The first guinea pig revealed on section an extensive edematous area on the left side, extending from the axilla to the groin. The tissues about the site of inoculation were necrosed and the inguinal glands enlarged. The peritoneal cavity contained a small quantity of bloody serum. The spleen was enormously enlarged, dark red, and covered with small yellowish spots. The pericardium contained considerable straw-colored serum, and the heart's blood was fluid.

The second guinea pig presented on section a coagulation necrosis of the whole left side of the abdominal wall, more intense at the site of inoculation. The axillary and inguinal glands were enlarged and reddened. Small hemorrhages surrounded the inguinal glands. The spleen was as large as in the first guinea pig, but did not show the yellow spots. The lungs were normal, but the pleural cavity contained a small quantity of bloody serum.

The white rat presented evidences of intense infection. At the point of inoculation there was an area of coagulation necrosis surrounded by a considerable area of edema. The spleen was four times its normal size, dark and friable.

The monkey, which died on the seventh day, presented the most beautiful and typical lesions of bubonic plague. In addition to the lesions described above, there was a well-marked pneumonla and an enormous enlargement of the axillary glands on the left side. The mass was as large as a walnut. Cover slip preparations made from the heart blood, spleen and lymphatic glands of all of these animals, and stained with anilin colors, particularly with thionin, showed the presence of an organism in enormous numbers which corresponded morphologically and in staining reactions to that of the bacillus of plague. Pure cultures of the organism were obtained from all the organs of these animals, as well as from the glands removed from the Chinaman.

CASE NO. 2.

Chew Gam died March 15th at 723 Sacramento street, aged 22 years. No clinical history obtainable. The friends of the deceased gave conflicting stories as to his illness, some claiming that he had been sick for over two months. When the body was seen for the first time the face was enormously swollen and edematous. The skin of the whole body was greenish black, and large blebs had begun to appear on the dependent portions of the body. The body had the appearance of having been dead a week. On section there was found very little enlargement of the lymph nodes. The lungs were dark and congested, but showed no evidence of pneumonia. The heart was very soft, with thin walls. No valvular lesions. There was considerable turbid fluid in the pericardial, pleural and peritoneal cavities. The spleen was enlarged, very dark and friable. The intestines showed evidences of inflammation. Microscopical examination of the blood and spleen demonstrated putrefactive organisms in large numbers and a few bacilli which had the appearance of the bacillus of plague. Attempts made to isolate this crganism from the rest were successful. Cultures so Isolated were sent to Dr. Kinyoun with the request that he inoculate an animal from them. I was informed that the animal died within thirty-six hours of what appeared to be an acute toxemia, and on examination very few organisms were found in the tissues except at the point of inoculation. These gave a beautiful and typical picture of plague.

CASE NO. 3.

Ng Ach Glng, age 35 years, died March 17th at 905 Dupont street. No accurate clinical history obtainable. Man found dead and immediately thereafter turned over to the undertakers for burnal. At the autopsy, performed forty-eight hours after death, the body was found to be fairly well nourished. Considerable discoloration of skin. On section the glands were found to be not enlarged. The perltoneum contained about three pints of bloody fluid. The intestines were reddened; the blood vessels of the mesentery engorged. The spleen was slightly enlarged and congested. One of the most remarkable features was the complete transposition of the viscera. The spleen occupied the right side, the liver the left, the caecum being in the left iliac fossa. The lungs were edematous and hypostatically congested. The pericadium contained about two ounces of flocculent serum. There was also a considerable quantity of bloody serum in each pleura. The heart was flabby, the walls of the ventricles very much thinned. The heart cavity contained several clots. Specimens were taken from the spleen and heart's blood for microscopical examination. On microscopical examination of specimens made of these materials, it showed quite a number of putrefactive organisms present, and in addition thereto was a short, thick bacillus, with rounded ends, which had the appearance of the bacillus of bubonic plague. It was readily decolorized by Gram's method. Animal inoculations were made from this material, which killed a gumea pig within thirty hours and a white rat in five days. Dr. Kinyoun and Ryfogle were present at the autopsy.

CASE NO. 4.

Len Sing Kong, age 47 years, died March 18th at Oneida place. When seen forty-eight hours after death the face was swollen and edematous. The skin of the whole body and part of the face and neck was a greenish black. Very little enlargement of the lymph nodes. The lungs were dark and congested, but there was no evidence of pneumonia. The heart was very soft and flabby, the walls of the ventricles thin, but no valvular lesions present. There was an inflammation of the peritoneum, the cavity of which contained one or two pints of turbid bloody fluid. The spleen was enlarged and very dark and soft. Microscopical examination of the blood and spleen demonstrated myriads of putrefactive organisms, and also a short, thick bacillus with rounded ends, corresponding morphologically and in staining reactions to the bacillus of plague, and also corresponding in every respect to the organism found in the previous cases. This organism was not isolated in pure culture.

CASE NO. 5.

Law An, male, age 38, a resident of California for thirty years, died April 24th in St. Louis alley, off Jackson street. This man had a large bubo in the left femoral region. Incision disclosed considerable bloody fluid and hemorrhages into the surrounding tissues. Cover slip preparations showed, among other organisms, the bacillus of plague, and two guinea pigs were inoculated, with the result that one died in fifty-eight and the other in sixty-one hours. Both these animals showed typical lesions of the plague, and the bacillus was found in large numbers in the spleen and heart's blood.

CASE NO. 6.

Lim Fa Muey, female, age 16 years, died at 739 Clay street on May 11th, seventeen days after the fifth case. She had a large bubo on the right side in the femoral region, over which a sticky black plaster had been applied by the Chinese

physician. The glands were as large as a walnut, dark, and the interior soft and mushy. Smears showed the specific bacillus, and its identity was confirmed by inoculation experiments on animals.

CASE NO. 7.

Chew Sam died May 11th at 717 Jackson street; was a merchant, aged 38 years, and had been fifteen years in California. I saw this case on the day of death with Dr. Wilson, at which time there was nothing visible to account for death, and the only suspicious thing about it was the heat of the body, which was quite noticeable, although twelve hours had elapsed since death. There was some distension of the abdomen with gas. There was a slight enlargement of the lymphatic glands in the femoral region, more marked on the left side, and these I removed for examination; but their appearance was so innocent that I set them aside and did not inoculate with them until forty-eight hours after their removal.

The next day we went to perform an autopsy and found the body in such a state of decomposition that we could not have recognized it as the same one we saw eighteen hours before had it not been for a secret mark which we use to prevent substitution of bodies. The face was puffed up and edematous, abdomen almost ready to burst with contained gases. Skin discolored all over. The heart was very flabby, walls thin and ventricles distended with gas. The lungs were normal. Peritoneum slightly inflamed. Some fluid in both pericardial and peritoneal cavities. The spleen was much enlarged, being six inches long, four inches wide and two inches thick. Color a dark greenish slate, with reddish patches. Smear preparations from the blood and spleen showed many organisms, but nothing resembling the bacillus of plague. Animals inoculated from the spleen died of a toxemia, but no pest organisms could be demonstrated in them.

The lymphatic glands, which were removed on the 11th, the day before autopsy, were slightly enlarged and showed slight hemorrhages into the gland substance; but they were firm and otherwise normal. A smear preparation showed a few organisms resembling the bacillus of plague, as seen in cultures. A guinea pig was inoculated with an emulsion of the glandular substance, and died on the sixth day with the most beautiful and typical lealons of plague. The spleen was at least ten times its normal size, covered with yellowish spots which, when examined, showed the presence of the plague bacillus in enormous numbers and in pure culture. The whole of the abdominal wall was edematous and an extensive coagulation necrosis about the site of inoculation. The bacillus was isolated from the splean in pure culture. The appearance of the body and also the cardlal lesions and general condition of the viscera, were in every way identical with cases 2, 3 and 4, already reported, in which difficulty was encountered in isolating the organism. It is believed, in view of the facts of this case, that if the glands had been taken from cases 2, 3 and 4 as soon after death as in this case, and animal inoculations made from them, the same results would have been obtained. In this case, before the results of animal inoculation were known, the obscurity of the lesions seemed to be more in keeping with berl berl than with bubonic plague.

CASE NO. 8.

Chin Moon, female, aged 16 years, employed as a domestic at 730½ Commercial street. She was attended by a regular physician, who stated that she first saw the girl three days before death, at which time she was suffering from headache, high fever, nausea and pain in the iliac region. It was at first thought that the case was one of typhoid fever, and she was sent to the Pacific Hospital. On arriving at the hospital she was in a moribund condition, dying the following day, after an illness of about five days.

The body, when I saw it shortly after death, was well nourished and presented no evidences of long illness. In the right femoral region was an obscure swelling, which on incision proved to be a single (or possibly two) lymph nodes about the size of a walnut. The tissues in the region of the glands were very edematous and the gland substance was very dark and hemorrhagic. Smears showed the bacillus of plague, apparently in pure culture, which was confirmed by animal inoculation.

CASE NO. 9.

Herr Woon Jock, age 53, male, laborer, ten years in California, had recently arrived from Stockton. He died May 17th at 740 Pacific street. Examination showed a bubo on the left side in the femoral region. The skin over the swelling was slightly discolored. The gland was dark and mottled on section, contained considerable serum, and the glandular tissue was soft and mushy. The smear preparation showed great numbers of the bacillus of plague, the identity of which was confirmed by animal inoculations.

CASE NO. 10.

Dang Hong, aged 40, male, Mongolian, laborer; resident of California for the last sixteen years; residence and place of death, 706 Pacific street; died May 29th, at about 2:20 A. M. I saw this case with Dr. Wilson on the evening of May 29th at Main Fook & Co.'s undertaking shop, 706 Pacific street. There was a large fluctuating swelling under the left side of the jaw and a slight enlargement of the glands in the femoral region. I cut down on the glands on the left side and found them necrosed, and some thick pus present. A smear preparation showed the plague bacillus in the glandular tissues from both sources.

The next morning, May 30th, at 11 A. M., an autopsy was performed, at which the following-named gentlemen were present: Drs. Shrady, Cable, Montgomery, Kinyoun, Wilson, Morrissey and myself.

Post-mortem Examination—Lungs normal, heart muscle pale and flabby. About six ounces of bloody serum in the pericardial sac. Pluras contained about a pint each of the same fluid. Peritoneal cavity contained three or four pints of the bloody serum. No lesions of Peyer's patches; congestion of the peritoneal coat of the small intestine in spots. Great omentum showed intense congestion. The spleen was perceptibly enlarged and its substance a reddish brown color. Mesenteric glands enlarged. Animals were inoculated with the emulsions made from the lymphatic glands by Dr. Kinyoun and myself, independently, and all died with typical plague infection.

CASE NO. 11.

Chan Kuey Kim, aged 49, single, in California twenty-two years; was a clgar-maker. Died June 2d, at 10 A. M., at 817½ Clay street, between Dupont and Stockton. An unreliable history of nineteen months' illness with cough was obtained from the undertaker and the Six Companies' physician. It was also stated by others that he had been sick for only four or five days.

Post-mortem Examination—The body was that of a large, well-built and well-nourished man, who would probably weigh 175 pounds. There was an incision in the left groin and on the right side of the neck, from which the lymph nodes had been removed. The integument was beginning to turn dark all over the body. but was more marked on the face and neck. The median incision passed through about an inch of fat. The lungs were dark and congested, but otherwise normal. The pericardium contained about 60 cc. of bloody serum. The heart was a trifle flabby, but showed no valvular lesions. Peritoneum dry. Spleen enlarged and showing petechial hemorrhages beneath the capsule. A cross section showed numerous yellow dots all through its substance, which was soft and friable. The

mesenteric glands were enlarged and showed evidences of intense inflammation. Kidneys normal. By enlarging the incision found in the left groin a lymph node about the size of a hazel nut was found, which was necrosed. Microscopical examination of this gland and of the heart's blood and spleen showed the presence in enormous numbers of the plague bacillus.

The autopsy on this case was performed by Dr. Donnelly, Assistant Bacterlologist, and was witnessed by Dr. Wilson, Assistant City Physiclan, Dr. Henderson, member of the State Board of Health, and myself. Drs. Henderson and Wilson accompanied me to the laboratory, where we were joined by Drs. Kinyoun and Baum, and where the preliminary examination of the blood, spleen and lymphatic glands was made and witnessed by the above-named gentlemen. A cover slip preparation of the blood stained with thionin, showed a marked leucocytosis and the presence of large numbers of the bacillus pestis, which were short rods with rounded ends, bipolar staining and frequently occurring in pairs. The Gram method of staining was also tried, and they were found to decolorize perfactly. The splaen and lymphatic glands were simply crowded with large masses of the same bacilli, which was enough in itself to establish the diagnosis; but, that there might be no question about it, a guinea pig was inoculated with an emulsion made from a piece of the spleen, with the result that it promptly died on the sixth day with the most typical and positive appearances of plague. The organism was recovered from the organs of the guinea pig in pure culture and has been fully identified. Another pig was inoculated with this culture with the same result.

CASE NO. 12.

Jay Man Tong, male, aged 60, merchant. Died June 9th at 759 Clay street, between Kearny and Dupont.

According to the certificate signed by physicians in the employ of the Chinese, he had died of angina pectoris and the duration of the cause was one year. Some of his relatives stated that he had complained of pains in the chest for a year and some cough, more marked toward the last.

Autopsy—A large, well-developed, rather fat man, about five feet ten inches tall and weight 180 pounds. Pericardium contained two or three ounces of clear serum; impaired tricuspid valve. Lungs normal. Intestines very dark, inflamed, mottled, distended with gas. Injection of the vessels of the mesocolon. Appendix normal. Spleen slightly enlarged. No marked enlargement of lymph nodes. Smears from the spleen showed the plague bacillus, but in small numbers. The bacillus was obtained in pure culture from the spleen by the inoculation of animals, which died of typical plague infection.

The question naturally arises, What was the method of introduction of this disease to our shores and when did it occur? That infected ships have arrived here from the Orient is known.

On June 27th, 1899, the Nippon Maru arrived from China, and it was found that a suspicious death had occurred aboard and the body was burned at Nagasaki. Another case died before arriving at Honolulu, at which place an autopsy was performed and Dr. Carmichael of the United States Marine Hospital Service demonstrated the plague bacillus. Five days after leaving Honolulu a woman died and was buried at sea. After reaching this port and entering quarantlne, two Japanese, presumably from fear of being quarantined on board a ship where plague had been, jumped overboard and were drowned in the attempt to swim ashore. Another ship, the Gaelic, arrived shortly after with a history of a suspicious death occurring two days after leaving Hong Kong, and the body was burned in the crematory at Nagasaki.

The possibility of articles of merchandise carrying the disease must not be forgotten, although this mode of propagation has never been actually proven. Instances can be cited, however, in which no other mode seems possible.

Plague was discovered in Honolulu in December, 1899, and the port was immediately closed, nothing being allowed to pass out to the neighboring islands. A month and a half after this plague appeared in the island of Maui, although absolutely no communication had existed between there and Honolulu for ninety days. Investigation showed that this outbreak appeared shortly after the Chinese New Year, when a number of Chinese had gathered together and a merchant had opened a package of candies and food stuffs which had been in his store for two months before the epidemic appeared in Honolulu. Nine cases of plague appeared Immediately, and the supposition is that the germs existed in the imported food products.

That the existence of plague in San Francisco is a matter of great seriousness and that its extinction is a tremendous undertaking is a statement that admits of no doubt, when one considers the nature of the disease, its terrible fatality and its persistence in a locality where it has once gained a foothold. The question of how and where the infection exists here during the interval between cases is interesting. It may be that cases which remain undiscovered exist, forming a continuous chain, but none of the discovered cases have been traced directly to a preceding one, so the continued existence of the virus among the rats and in infected merchandise and houses seems most plausible. That the germ is not such a delicate one as has been supposed is shown in the experiments of Rosenau, who succeeded in demonstrating that the germs retain their virulence after having been dried in albumen-gelatine balls for seventy-five days at 20 to 23 deg. C.

Eduardo Germano found the bacillus to remain alive in various kinds of earths and on linen, wool and silk for sixty days at ordinary temperatures, if not allowed to dry.

That the continued existence of the disease is a more certain danger here than in a warmer climate is shown by the German commission who found that the bacillus lost its power of infection when dried in eight days in India, but after returning to Germany it lived twenty-eight days under the same conditions of drying but in the cooler climate.

An interval of thirty-seven days elapsed between our fourth and fifth cases, showing, if no undiscovered cases occurred between, that the transmission here has not been by personal contact. A reference to the accompanying map will also show how widely scattered were the cases, and attention has frequently been called to the lack of connection between the cases. It is true, owing to the nature of the people among whom the disease exists, that little dependence can be placed on their statements of location of deaths and relation of one case to another. We have only their statements that none of the individuals were related or lived in the same house. There is no way of connecting one man with another by his family name, for they have none. It is also known that they frequently move a dying person to some other house to die, or they move the body after death and before reporting it. Some of the cases have been found in Chinese undertaking shops and we have no way of proving where they came from. To one unacquainted with the Chinese colony in San Francisco, it may not at first be evident what their object would be in falsifying about the cases, but, as will be shown later, the general conditions and the opposition to the Health Department were pecullar.

Returning again to the question of the origin of the disease in San Francisco: May it not have been here much longer than even the date of arrival of the Nippon Maru in June, 1899, and not yet have reached the acme of its development or passed the stage of "pestis minor" and acquired that degree of virulence necessary to its rapid spread?

Apropos of this suggestion are the circumstances surrounding the appearance of a disease here in 1898, the details of which are as follows: I find the following in the records of the Health Office:

Report of Dr. Wm. S. Hereford, City Physician, dated November 22, 1898:

"Yesterday afternoon I was notified by telephone by Dr. Minnie Worley, No. 5 Prospect place, that a number of deaths had occurred at certain places in Chinatown among the Chinese, the cause of which the Chinese as well as herself regarded as something contagious. She stated in an interview with me this morning that four Chinese, i. e., a clerk, two cooks and a child, had contracted the disease at 1022 Dupont street, and that she had seen one of these cases, Chen Chip, who had been taken suddenly ill and had an abnormally high temperature, 105 deg., and that he died November 20th at 840 Washington street. She was unable to determine the exact nature of his complaint. Also that at Sam Wung Ka's store on Dupont street, between Washington and Jackson, three more men had died and one was ill at the present time, and that the store had discontinued business on account of the same. She stated that a man was sick in one of the houses in St. Louls alley, corner of Jackson, suffering from the same disease.

"Our first call was at Quong Quck's store, 1022 Dupont street, a wholesale tea and general provision store; a small store above and a large cellar below, full of tea. Everything was clean and in good sanitary condition; new patent closet, etc., and no bad odor anywhere. Here they informed us that they knew Chen Chip. He was about 23 years of age and had arrived from China about three weeks ago on the Belgic. That he had complained of catching cold and about two weeks ago he had chills and fever followed by a little cough, pain in the chest and spit a little blood. He did not die there, but some other place about two days ago. On calling at 840 Washington street, at the place mentioned by Dr. Worley where Chu Chip had died, everybody denied all knowledge of the same. They all agreed that nobody had died there recently."

The rest of the letter relates that the Chinese denied and he was unable to find that any other cases than Chu Chip had been sick at 1022 Dupont street as stated by Dr. Worley.

Here we have an account of a Chinaman recently arrived from China, and It would not have been impossible for him to have been suffering from pestis minor on his arrival, particularly as at that time the Federal quarantine officers dld not bathe and inspect Chinese as they do now.

The experience of Dr. Hereford in finding nothing but contradictions to Dr. Worley's statements are only our everyday experiences in Chinatown, and it is likely that her facilities for obtaining the facts, being a physician attached to one of the missions and having the confidence of the Chinese, were much better than Dr. Hereford's.

Dr. V. P. Buckley, now a member of the Board of Health, was called about this time to attend a sick Chinaman, whom he had known for years. Dr. Buckley's account of the case is as follows:

On November 22, 1898, I was told to call and treat a sick Chinese at 913 Dupont street, near Washington street, this city. I found on arriving there that the patient was a man whom I had known for years, named Leong Chun Chew. aged 46 years, by occupation a teamster or expressman, who had resided in California thirty-six years.

The inmates of the house exhibited signs of the greatest alarm and anxiously awaited my diagnosis of the case, as two Chinese physicians had told them a few moments before my arrival that Leong was suffering from bubonic plague.

On examination I found the pulse 140, temperature 104 F. and respiration accelerated to 35 per minute. The skin was dry; tongue very dry and covered with

a dark brown coating. The day preceding my visit the patient had had several very severe attacks of vomiting, and from description of same as given by attendant I concluded that it was haematemisls. He complained of a painful swelling a few inches below Poupart's ligament on the right thigh. I then found a circumscribed, slightly elevated and somewhat oedematous swelling about $2\frac{1}{12}$ inches in diameter and exquisitely painful when touched. The staggering and appearance suggestive of drunkenness, as described by writers on plague, were strongly marked and were observed when the patient arose from his bed and went into another one in an apartment at the rear of the house. His bowels were constipated. There was a diminution in the quantity of urine passed during that and the preceding day. An examination was made of the urine for albumen only, but not a trace of it could be detected. Some pulmonary engargement was present, but no hepatization of the lungs. Purpuric spots were distributed over the body and the extremities. The attendant said that the patient had been delirlous during most of the night before.

Considering the case one of bubonic plague I so reported to the Acting Health Officer, Dr. John Gallwey, and arranged to call with him and see it at 8 o'clock the following morning. On our arrival there at that hour we found the house deserted by all its inmates except one old Chinaman, who told us that Leong Chun had died during the night. On inquiring of the old man he indicated the room, where we found the body on the floor, covered with a sheet. After learning all the facts in connection with the case, Dr. Gallwey concurred in the diagnosis of bubonic plague. Two other inmates of this house died about one week before Leong Chun. One was his daughter, 10 years old, and the other a woman about 35 years of age named Sam Goo. Intelligent and reliable witnesses assured me that these two females while ill had symptoms precisely similar to those of Leong Chun Chew, and that four Chinese physicians who had seen many victims of the plague in China, and treated Leong's daughter and Sam Goo, were positive that these two had died of the dread disease.

An autopsy was performed on this case and there was found:

Brain-Intense congestion of the vessels of the pia, also congestion of the smaller vessels of the brain substance.

Lungs-Congestion and edema, with post-mortem softening.

Heart-Slightly enlarged, both ventricles flabby and fatty degeneration present. Splean-Apparently normal in size, soft and flabby, tears easily. No lestons apparent.

Kidneys-Slightly enlarged, soft, congested, show apparent lesion of acuts diffuse nephritis.

Slight injection of the vessels of the meso-colon. No enlargement of the retro-peritoneal or mesenteric lymph nodes, no enlargement of the cervical, axillary or inguinal lymph nodes.

Post-mortem decomposition well advanced.

Cause of death-Acute diffuse nephritis, complicated by pulmonary congestion and edema.

A subsequent report four days later states that the plague bacillus could not be demonstrated.

To analyze this case we have:

FOR PLAGUE.

AGAINST PLAGUE.

Short Illness.

Other similar illness in same house.

Fever.

Delirium.

Unsteady gait, staggering.

Painful bubo.

Purpuric spots.

Opinions of Chinese who had seen plague. before.

Opinion of attending physicians.

Autopsy report on brain, lungs, heart, spleen, vessels of meso-colon and congestion of kidneys do not negative plague, but to some extent confirm.

Bacillus not found.

Apparent lesion of kidneys.

Again, to examine into the value of the pathological findings we have:

AGAINST PLAGUE.	FOR PLAGUE.
Found acute diffuse nephritis "apparent."	No albumen in urine.
No enlargement of lymph nodes.	Dr. Buckley and Dr. Galiwey found a bubo in the left groin.
	No inoculation experiments.
Garage Maria	Gody already decomposing, thus rendering isolation of the bacillus by culture methods difficult if not impossible.
Congestion and edema of lungs.	Congestion and edema of lungs not in- compatible with plague.

In explanation of the apparent discrepancies in the clinical and post-mortem accounts it may be stated that the congestion and cloudy swelling which may exist in the kidneys of a plague septicemia case could readily mislead one who is not aware that plague is nearer to him than 5,000 miles. So also with the enlargement of the lymph nodes in the femoral region of the thigh. I have seen some cases in which the swelling was hardly noticeable to the eye, yet incision

disclosed a giand as large as a walnut imbedded in the edematous fatty tissue. If hurried and unsuspecting a pathologist could readily overlook the enlarged glands.

In giving this case I do not mean to say positively that it was piague, but in view of the fact that we have had cases recently that looked as much like it as this and were unable to isolate the bacillus and others which did not look as much like plague as this and did succeed in demonstrating it hacteriologically, it is fair to assume the probability of this case having been one of plague.

In support of the contention that plague could have existed here in November, 1898, and to show the danger that may exist from the ambulent pestis minor, I will cite instances of its slow development in other cities. Indeed, it would seem that this form of beginning was the rule and not the exception with this disease, and that it is in the sense of security which is the outcome of familiarity with occasional "sporadic" cases that the great danger lies.

Upon perusing the medical history of the plague in any part of the world one is immediately struck by the frequency with which epidemics have been preceded by ailments of indefinite nature; cases of fever and glandular swellings, without any marked increase in mortality, sometimes extending over periods of one or two years or more before plague is recognized. In this respect plague does not differ from other contagious diseases, as diphtheria, small pox and typhoid fever, for in these three diseases there are often cases of "mild sore throat," "diarrhoea" or "chicken pox" preceding epidemics of the severe form. The mild cases are a fruitful source of contagion, and in the case of plague the mild cases are even more difficult to recognize.

In Caicutta, at the end of 1896, cases of fever with glandular swellings were reported to the municipal authorities, but although the plague bacillus was demonstrated in five out of eleven cases brought to the notice of the authorities, the existence of plague was denied by a commission appointed to examine the evidence. It is significant, however, that they ordered the strictest measures of isolation and disinfection. In 1898 its presence could no longer be denied and 192 deaths occurred. In 1899, two and one-half years after its first appearance, the severest epidemic of all broke out.

In Bombay, cases of fever with glandular swellings had been observed many months, and, according to some, a year or two before the city was declared infected on September 23d, 1896.

In Macau, a Portuguese colony thirty miles from Hong Kong, six cases of plague appeared in May, 1894. These were all the cases observed until nine months later it reappeared and by May, 1895, the death rate was eighty per day.

In the city of Oporto, which was declared free of infection on February 9th, 1900, two cases have just been reported (July, 1900).

A notable complication of affairs in our plague experience in San Francisco has been the bitter opposition of the press, the Chinese and of the merchants (excepting an association of the heavier wholesalers), but as this has been a common experience in other places it was not so much to be wondered at.

Another disagreeable thing was the opposition engendered by the ignorance and superstition of the Chinese, aided by lawyers who encouraged them to resist necessary measures of the Health Department by legal process, to the pecuniary advantage of the aforesaid lawyers.

But, most disgraceful of all, has been the enlistment on the side of opposition to the Board of Health of medical men, although, be it said to the honor of the profession, that almost without exception they belonged to the faculty, or society, of a certain medical college a prominent member of which was the prime mover in the opposition. The bacteriologist of this college, and one other, who was also in

the employ of the Chinese, were the only bacteriologists in the City who could be obtained who would, after an examination, consent to take the position that these were not plague cases.

It has even been stated by these bacteriologists that the organism which I have described, and which they acknowledge was the cause of death of these Chinese, is the bacillus of hog or chicken cholera, and they state, among other things, that the said chicken cholera bacillus is pathogenic to man and kills rats as readily as does plague! By declaring the bacillus of chicken cholera pathogenic to man what a vista of epidemic possibilities is opened up for the contemplation of the millions of people in the Mississippi valley.

In conclusion, the determined enforcement of sanitary measures on the part of the Board of Health, the thorough cleansing of the quarter, and the careful disinfection and quarantining of infected houses, has undoubtedly been of inestimable service in checking the development and increase of virulence of the disease, and it is to be hoped that it will continue to be effective. Respectfully submitted,

W. H. KELLOGG, M. D., Bacteriologist.

REPORT OF CHIEF PLUMBING INSPECTOR.

San Francisco, July 1, 1900.

To Dr. A. P. O'Brien, Health Officer-

Dear Sir: Herewith please find my biennial report of the work accomplished by the Plumbing Department during the two years ending June 30, 1900:

To summarize, the work performed by this department is as follows:

Number of plans submitted, 1,099; representing 1,305 houses.	
Number of inspections in construction 2,32	9
Number of inspections on completion	0
Number of inspections on complaints received from Sanitary	
Inspectors 5,51	7
Number of abatements made on complaints received from	
Sanitary Inspectors	8
Number of inspections made on complaints received by Plumb-	
ing Department	5
Number of abatements made on complaints received by Plumb-	
ing Department	6
Number of inspections on work granted by permit 1,95	6
Number of abatements on work granted by permit 1,22	1
Number of inspections made in the Latin and Chinese quarters 16	7
Number of abatements made in the Latin and Chinese quarters 10	8
Number of feet castiron sewer inspected	1
Number of feet ironstone sewer inspected	
Number of inspections made on sewers	
Number of traps at curb	
Total number of inspections made	

And any special details which may be assigned to our department.

The old work coming to our department from Sanitary Inspectors represents all parts of the city. Its attention required a great many visits and consequently a great deal of time before the nuisances were abated.

In the district south of Market street, in that territory lying between First and Twelfth streets south to the bay, composed as it is of many small streets thickly populated and owned in blocks in most cases by wealthy people, practically no attention whatever has been paid to the sanitary construction of dwellings, which have consequently been a standing nuisance for years. As complaints are continually coming in from this quarter a great deal of our time has been consumed in attending to this work.

In the Chinese quarter the work of this department has been of a very different character. The plumbing in many of the Chinatown habitations is all that is required by law, but no attention is paid to the cleanliness of the fixtures or to the compartments wherein these fixtures are placed.

While the plumbing of this district has been materially improved and has contributed measurably to a better sanitation, conditions will not be what they

should be until many other evils receive attention. In my opinion it is imperative that foul basements with decayed wooden floors should be closed or be made sanitary. Overhanging, filth-saturated porches should be removed. Unventilated, underground sleeping apartments, where laws regulating cubic air and sanitary precautions are disobeyed, should be remodeled to conform to the health rules adopted by your honorable body. It seems to me imperative that the people of this district should be made to conform to the laws obeyed by other classes in the eity.

In the Latin quarter of the city conditions similar to those existing south of Market street are to be found. If anything, the Latin quarter is from a sanitary point of view much worse than the district south of Market street. The buildings are extremely old and have hardly an apology for sanitary appliances. The streets are poorly sewered, the buildings are inadequately ventilated and the plumbing, meager as it is in the district, is of the most primitive character. There is in this district the gravest need for sanitary reform.

From the Mission district many complaints of poor sanitation have been received and have been given attention. The district is far from being in a satisfactory sanitary condition.

The Bernal Heights, Sunset and Richmond districts suffer greatly from a lack of sewers, which should be supplied without delay. Respectfully submitted.

JOHN J. SULLIVAN, Chief Plumbing Inspector.

REPORT OF DISINTERMENT INSPECTOR.

San Francisco, July 1, 1900.

To the Honorable Board of Health

Of the City and County of San Francisco-

Gentlemen: I herewith present my report of disinterments and removals for the fiscal year ending June 30th, 1900.

In addition to the supervision of these disinterments I have maintained a constant surveillance over the cemeteries where interments take place, observing the depths of the open graves and inspecting the receiving and private vaults. These latter visits averaged three a week to each of the cemeteries.

Respectfully,

LAURENCE WALSH, Disinterment Inspector.

REPORT OF CITY PHYSICIAN.

San Francisco, July 1, 1900.

To the Honorable the Board of Health

Of the City and County of San Francisco-

Gentlemen: I herewith respectfully sumbit for your consideration the report of the City Physician for the fiscal year ending June 30, 1900.

This branch of the Health Department has the particular care of the indigent sick, the prisoners in the County Jail, the inspection of the dead Chinese, and the Issuance of death certificates for the burial of the same; also the care of patients at the Twenty-sixth Street Hospital.

Though the calls upon the City Physician from the indigent sick have been numerous during the year, I am pleased to say that the City has been free from epidemic.

The Board has shown its wisdom in the selection of a female physician to look after the indigent sick women and children. This was long needed in this department.

The health of the prisoners in the jails has been as good as could be expected with their surroundings. Jail No. 1 is a very old and dilapidated building, and its sanitation is not of the best. Jail No. 2 is in a better condition, but Jail No. 3, the old Industrial School, should be entirely rebuilt.

The inspection of the Chinese dead is under the immediate charge of Dr. Frank P. Wilson, Assistant City Physician, and will be considered in his report.

The Pesthouse at the Twenty-sixth Street Hospital is a place totally unfit for habitation. In many places the roof is entirely uncovered, and during the rainy season the rain pours into the building, rendering it damp and unhealthy. Some means should be taken to cover the roof before the next winter sets in.

I think it would also be advisable for this Honorable Board to endeavor by some means to have the lepers at the Twenty-sixth Street Hospital sent to the leper colony at the Hawaiian Islands.

The Smallpox Hospital is well suited for its purpose, and is a well-conducted institution. During the year 44 cases were admitted, of which number 7 died, a mortality of less than 16 per cent., which I think is an excellent showing. The hospital has during the year been under the care of Drs. Tillmau and Prior. During May we were threatened with an epidemic of smallpox, the disease having been brought here from Kansas by a womn who secluded herself in a lodging-house for three weeks before being discovered. Prompt and vigorous measures were used, and the spread of the disease was prevented.

Previous to my appointment to this office it had been the custom to fill the prescriptions given the indigent sick living east of Larkin and Ninth streets at the City Receiving Hospitals. This was changed, so that now all prescriptions are filled at the City and County Hospital. This works an injustice to the sick, the majority of whom come from east of Larkin and Ninth streets, and are both physically and financially unable to travel the long distrance to the City and County Hospital. Yours, very respectfully,

J. G. MORRISSEY, M. D., City Physician.

REPORT OF F. P. WILSON, M.D., ASSISTANT CITY PHYSICIAN.

SAN FRANCISCO, July 1, 1900.

To the Honorable the Board of Health

Of the City and County of San Francisco-

Gentlemen: I have the honor of presenting herewith the annual report of the Assistant City Physician for the fiscal year ending June 30, 1900. Although my term of office dated from January of the present year, I have, nevertheless, included the resume of work performed by my predecessor during the first six months of the fiscal year.

The diseases treated at the Branch Jails during the last-mentioned period of time not having been registered, it has been impossible to include them in the report.

Yours very respectfully,

F. P. WILSON, M. D.,
Assistant City Physician.

REPORT OF BEATRICE M. HINKLE, M.D., ASSISTANT CITY PHYSICIAN.

SAN FRANCISCO, July 1, 1900.

To the Honorable the Board of Health

Of the City and County of San Francisco-

Gentlemen: I have the honor to submit herewith the semi-annual report of the Assistant City Physician:

It will be observed that the report consists of the work of five months only, dating from February 1st of the current year, that being the date on which the duties of this office were assumed.

It is the pride of every city to afford proper care for the relief of the indigent sick within her boundaries, and it was with this idea in view that your Honorable Board confirmed the appointment of a woman to administer to the needs of the destitute, ailing women and children of this City.

That there is ample field for the exercise of professional skill as well as sympathy and material assistance in many cases, the work of the past few months has entirely proven.

The office is as yet new, but I am thoroughly convinced that the coming year will see the usefulness and necessity of this department greatly augmented.

There is much difficulty in dealing with this class of patients, to obtain proper nursing and care in order to gain the best results. The district nurses, however, are valuable aids in this respect, and in several of the most serious cases reported the honor of the satisfactory results obtained must be shared with them.

In this connection I would like to urge upon the attention of the Board the necessity for providing a proper hospital for children. Almost every city in the Union, of the size of San Francisco, has a suitable modern hospital for their especial care.

It is true there is in this City a Children's Hospital. There, however, a very limited number of cases is treated free of cost, and it is frequently so crowded that charity patients are constantly turned away.

Patients suffering from contagious diseases cannot enter it at all, unless they are prepared to pay a high charge, and those who can afford this usually do not need to send their children to an establishment of this kind.

I am well aware that the City and County Hospital receives children, but it is a notorious fact that the proper means for caring for these cases is entirely lacking. There is no separate ward for children. There are no facilities for the proper isolation of contagious diseases, and the promiscuous association of children with adults, necessitated by the existing conditions, is in the highest degree objectionable.

What is needed is a hospital for the children of the poor—a separate building where children can be by themselves and intelligently cared for.

Every physician realizes the difficulty of handling serious cases in the homes of the poor, where means are small, space is limited, and intelligence often lacking. These difficulties are doubled when it comes to the care of contagious diseases. It is quite impossible to control the spread of contagion from one child to another where perhaps the entire family of father, mother and half dozen or more chil-

dren are all crowded together in two or three rooms. When the disease falls to infect the entire number it is certainly not due to good management. Such people seldom have the slightest understanding of the simplest sanitary precautions, and even when instructed cannot comprehend the importance of detail. However, were the understanding perfect, it is still impossible for a hard-working woman, struggling with poverty, and without means either to assist in the enforcing of strict prophylaxis or to keep such a child isolated or to refrain from contact with the rest of her children. Not only is she practically unable to help herself, but she looks in vain for help from other sources.

Cases of this class are avoided as much as possible by the district nurses for fear of carrying infection to other patients. The neighbors avoid the family, and consequently the mother is left to herself to nurse the sick child, and between times to administer to the wants of the others.

This is the situation which alone can be relieved by the establishment of such a hospital as has been suggested. The child would be removed at once from its surroundings, prompt and effective measures could be taken for the disinfection of the home, while the sufferer would be assured skilled treatment under conditions involving the least risk of the spread of the disease with which it is afflicted. Nor should it be left to the option of the parents whether they would send the suffiering child to the hospital or keep it at home. The safety of the family and those in the vicinity would be reason enough for the prompt removal of the child in all cases where it cannot be satisfactorily shown to the proper authorities that isolation and proper prophylaxis can be carried out in the home.

The necessity of such laws is recognized in England, and they are rigidly carried out, to the material advantage of the health of the community.

However, before the law is framed, it might be in order to provide the hospital.

Before leaving this subject, I would beg the privilege of a few words in regard to the sanitary condition of the dwellings and surroundings of these people, and also ask permission to offer a suggestion relating thereto.

As is fully realized by every one working along this line, the chief difficulty to be combatted in the treatment of the poor is that ever-present intruder "dirt." It is met with on all sides, and in spite of sanitary inspections still continues to thrive.

I am aware that when a complaint is filed, attention is given to the matter by the Sanitary Inspectors, but I also know, from my own experience in these quarters, that in many cases those who desire to be cleanly and object to the accumulation of dirt that confronts them, do not know what steps to take for rellef.

If, instead of waiting for complaints to be filed before inspection is made in those quarters inhabited by the poor, a monthly, or, failing in that, a quarterly house to house inspection could be instituted, I am certain that the results obtained would prove of great benefit to the community and a satisfaction to all those interested in the welfare of our City.

Were there this voluntary inspection, the need of complaint, and, I might add, the fear of consequences to those making complaints would be obviated. I realize fully when making this suggestion that the present force of sanitary inspectors is entirely inadequate to handle such a project over the large territory involved. However, I feel sure if the Board of Supervisors saw the conditions as they really exist in the small streets and blind alleys south of Market street and in the Latin quarter, they would appreciate the necessity for more vigorous measures, and support your Honorable Body in such efforts to the best of their ability.

In many cases it is the owners of the property who are as much to blame as the tenants, because they will not keep their property in proper sanitary condition unless compelled to do so. If both owners and tenants were made to under-

stand that the rooms and closets and basements were liable to inspection at any time, I feel sure it would have a most beneficial effect in producing more cleanly conditions in these quarters of the City.

In the meantime I venture to suggest that your Honorable Board authorize the various district nurses employed in this field to act as assistant inspectors, and that you issue to them the necessary badges. This would involve no additional outlay and yet would be the means of doing most efficient work. These nurses go into the homes everywhere and are thoroughly familiar with the sanitary or rather unsanitary conditions which obtain there. Laboring constantly in those parts of the City where the greatest need for this work exists, it would seem that these nurses should be the natural allies of the Sanitary Corps, and I am sure they would gladly co-operate with that body.

During March, while the regular vaccinator was detailed in the Chinese quarter, I substituted in the vaccination room for three weeks. Following that, in response to numerous complaints from parents of the hardships entailed by the trip to the City Hall, in order to comply with the law of compulsory vaccination, branch vaccination stations were opened in the sections of the City farthest removed from the Hall, namely, at the Potrero and on Telegraph Hill. The use of the offices in the schools in these districts was granted the Health Department by the Board of Education, and for about two months and a half, until vacation, weekly visits were made to the schools for the purpose of vaccinating the school children.

About three hundred children were disposed of in this way. Many of them had no intention of ever complying with this law, and your representative was constantly met with "My mother don't believe in vaccination and won't allow me to be vaccinated." These children were in most instances promptly sent home to inform their mothers that no vaccination meant no attendance in public school. This usually brought the consent of the parents.

If a law is worth enacting it is certainly worth enforcing, and it is owing to the laxity of the principals of the schools, and, in many cases, prejudice and ignorance of parents, that so many children are able to attend school without the necessary certificate, and in spite of free vaccination and attendance.

Herewith please find a statistical report of the work of my department of the past five months:

BEATRICE M. HINKLE,
Assistant City Physician.

REPORT OF PUBLIC VACCINATOR.

SAN FRANCISCO, July 1, 1900.

To the Honorable the Board of Health

Of the City and County of San Francisco-

Gentlemen: I hereby submit the report of the Vaccination Department for the fiscal year ending June 30, 1900:

Of other diseases I have no means of giving an accurate account as no record was made of such previous to my appointment. Since the 9th of January, however, there have been 66 cases of Impetigo Contagiosa (most directly due to pediculi), 19 cases of Mumps, 4 of Varioloid, 3 of Measles, 4 of Chickenpox, and an indefinite number of Vaccinia rashes and Tineae.

In these cases certificates were withheld by authority given me by Health Officer Dr. O'Brien until the children were cured of the various ailments.

I have been frequently informed, as already stated to your Honorable Board, that some physicians have issued certificates of successful vaccination to children whose arms, etc., were never even examined. This is manifestly unjust to those who obey the law although disliking it.

The only method of putting a stop to this is for the Board of Education to insist that every child in the Public Schools shall have a certificate from the Board of Health that he or she is in perfect physical condition (in so far as other children are in danger from contact). The present form of certificate issued by the Board of Education is faulty in construction or rather in the possibility of misconstruction. I have already presented suggestions as to a possible change.

The quarters allotted to this department are unhygienic despite the continuous fumigation, etc., as will readily appeal to the judgment of any physician; even parents frequently complain.

The percentage of successful vaccinations of those who return and report is approximately 95. As the work is too great for the help employed it is impossible to make a positive percentage.

There has, as far as I know, been no complaint of the work done in this department, which is more laborious than is generally considered by those who are unacquainted with its demands. Outside of the necessity of vaccination the subsidlary work of protecting children from other infections is of serious importance.

Respectfully submitted,

WM. GILBERT HAY, M. D.,

Vaccinator.

REPORT OF SMALLPOX HOSPITAL.

SAN FRANCISCO, August 9, 1900.

To the Honorable the Board of Health
Of the City and County of San Francisco—

Gentlemen: Below is the statement of cases in the Smallpox Hospital from December 26, 1899, to July 1, 1900:

Total number
Male12
Female 5
Cured
Died 2
Diagnosis-
Varioloid 4
Discrete Variola 8
Confluent Variola 5
Complication in fatal cases—
Broncho-Pneumonia 1
Gangrene of right arm 1
Number of cases bearing previous vaccination scars, 4; all varioloid.

Allow me to direct your attention to the need of a few improvements at the hospital.

Station ry washtubs are needed very much. At present the portable tubs are used, and after washing is done the contents are thrown upon the ground and allowed to seep in the earth anywhere behind the house. A good room can inexpensively be made in the cellar, where the sewer and water connections are handy.

To build to the ceiling the partitions in one ward of the hospital.

At present the room partitions lack 5 feet to reach the ceiling, allowing the disagreeable odors from bad cases and the ward privy to permeate the whole ward, making it very disagreeable, especially for the convalescents.

A good coat of paint upon the floors would be conducive to greater cleanliness, and a few feet of pipe placed upon the kitchen chimney would do away with a smoking range during a north wind.

Your attention is also called to the fact that the supply pipe from the water company lies very superficial on Army street, and it is liable to be cut at any time by the heavy teams. Twice during my stay was our water shut off completely, for four hours the first time and sixteen the second. Of course the cutting off of the water supply affects the leper as well as the smallpox. Knowing that if these suggestions are carried out, the Smallpox Hospital will derive much benefit therefrom, I am, very truly yours,

FRANK J. TILLMAN,
Resident Physician.

REPORTS OF EMERGENCY HOSPITALS.

San Francisco, July 31, 1900.

To the Honorable the Board of Health

Of the City and County of San Francisco-

Gentlemen: Herewith permit me to submit a report for the fiscal year ending June 30th, 1900, for the Emergency Hospitals and the Hospital for the Detention of the Insane.

This report includes a transcript of the records from June 30th, 1899, to January 8th, 1900, which I found incomplete, and from January 8th, 1900, when I took charge, to June 30th, 1900.

The total number of cases treated at the Central Emergency Hospital during this fiscal year was 5,267. At the Harbor Hospital there were treated 3,826, and at the Hospital for the Detention of the Insane there were admitted 537 patients. At the Park Emergency Hospital during the month of July, 1899 (this Hospital was closed July 31st, 1899), there were treated 41 cases.

On the 8th day of January, 1900, the new Charter went into effect and a new Board of Health was appointed, and shortly following, on the 13th day of January, I was appointed to take charge of the Emergency Hospitals and the Hospital for the Detention of the Insane. Previous to this time the Hospital for the Detention of the Insane had been under a separate management, but owing to the provisions of the Charter it again reverted to the care of the Board of Health. Some necessary changes were made in the conduct of this Hospital, notably the care of patients. Two stewards and two matrons were appointed, with some knowledge in regard to the management of insane people, and under my tuition they were further instructed, particularly in the best and most modern methods for controlling violent patients. Some little difficulty was experienced at first in educating these attendants for this peculiar line of work. There seemed to be a general idea that when a patient was violent he should be maltreated, but after personal instruction the attendants grasped the idea that brutality in any form was entirely unnecessary. The result has been that during the period of my incumberey no trouble has arisen in that department of any moment, and the criticisms heretofore made have been entirely wanting.

Under the old Consolidation Act the Central Emergency Hospital, or as it was then known City Receiving Hospital, had a separate appropriation, but under the Chauter all the Emergency Hospitals derive the money for their maintenance from the general appropriation of the Health Department. At the time that your honorable body took charge of the affairs of the Health Department there were outstanding bills against the Harbor Hospital amounting to \$1,261.33 unpaid. This legacy of debt from the preceding Board of Health, very naturally embarrassed the work of this entire branch of your department. Consequent upon this condition of affairs it was absolutely necessary for me to curtail all expenses, not only salaries but maintenance. Six of the surgeons originally appointed as my assistants had to be dropped from the payroll. Furniture supplies, beds and bedding requisite for the proper care of patients could not be purchased. In short, the most rigid economy was imposed upon me in order to make up the deficiency existing in the appropriations which remained to the credit of the Emergency Hospitals for the fiscal year ending June 30th, 1900.

For the ensuing fiscal year, although the appropriation granted this department by the Board of Supervisors was very much less than it should be, we are finding that it is possible to purchase supplies and maintain the Hospital in a very creditable manner, not, however, without the economy which has been observed for the past seven months. No margin has been allowed for the slightest additional expense; bearing in mind at the same time that the Park Emergency Hospital is closed.

The method of obtaining supplies, as provided for under the new Charter, is a vast improvement over the old system. It was formerly the practice to make

all purchases regardless of expense. The system of competitive bidding, as inaugurated under the new Charter, enables the City to obtain supplies of every description at reasonable rates, a fair estimate of the savings being at least 33 1-3 per cent. A serious item of expense in the Emergency Hospital is the cost of bandages. I have materially reduced this by purchasing the cloth and making it a part of the duty of the matron to manufacture them. The saving in this instance amounts to about 50 per cent.

Former statistics show the necessity for an Emergency Hospital in the great pleasure ground of this City. We all know that, particularly during the summer months, Golden Gate Park is crowded with men, women and children, and accidents, sometimes of a very serious character, occur there. At present the only way of attending to these cases is by sending an ambulance from the Central Hospital. An hour and frequently two hours must elapse before the injured can receive treatment. The Park Hospital was closed a year ago for lack of funds, and in my opinion should be reopened at once. A presentation of the facts, showing the necessity thereof, I am convinced would result in a sufficient sum of money being set aside by the Board of Supervisors for that purpose.

Respectfully yours,

EDWIN BUNNELL, Chief Surgeon, Emergency Hospital.

REPORT

—OF THE—

CITY AND COUNTY HOSPITAL

--- FOR THE - --

FISCAL YEAR 1899-1900.

REPORT OF CITY AND COUNTY HOSPITAL.

SAN FRANCISCO, Cal., July 1st, 1900.

To the Honorable the Board of Health,

Of the City and County of San Francisco-

Gentlemen: I have the honor herewith to present for your consideration the forty-seventh annual report of the City and County Hospital for the fiscal year 1899-1900.

The following summary has been compiled from the several statements included in this report:

SUMMARY.

PATIENTS.	NUMBER.	TOTAL.
Patients in Hospital July 1, 1899		380
Examined for admission during fiscal year	4,218	
·	508	
Rejected		3,710
Admitted		133
Born (not including 10 stillborn)		100
Total to be accounted for		4,23
Patients discharged—		
Cured	1,313	
Improved	962	
Unimproved	149	
Own request.	332	
Refused treatment	13	
Removed by relatives or friends	166	
Insubordination	23	
Referred to Insanity Commissioners	13	
Sent to Almshouse	101	
Sent to Pesthouse.	1	
Arrested	1	
Ran away	197 .	
Died	629	
Patients remaining June 30, 1900	331	
Total accounted for		4,23

REPORT OF CITY AND COUNTY HOSPITAL.

4

Least number of patients during the year (June 30, 1900)	331
Greatest number of patients during the year (January 16 and March 1, 1900)	426
Total number of days' t-eatment	37,706
Daily average of patients	377.36
Daily average officers and employes	137.52
Percentage of deaths to number treated	14.87
Average time under treatment (days)	32.55
Cost of subsistence per person, per diem	0.193
Cost of subsistence per patient, per diea	.2402
Total expenses per patient, per diem	.5814
Total amount expended during the fiscal year	97,977 73
Amount of appropriation for Hospital purposes	98,500 0ô
Balance remaining in Treasury June 30, 1900	522 27

The past fiscal year has been marked by many changes in the officials and other employees of this Hospital.

On October 1st, 1899, I felt obliged to resign the office of Superintendent Physician, and my successor, Dr. D. A. Hodghead, was installed into the office, which he held until January 10th, 1900, when I was again reappointed by your Honorable Body to said position under the Charter.

At the beginning of the fiscal year, various officials were appointed, a majority of whom were new to their duties, which made the carrying out of the work of the Hospital difficult for some time, and, in several instances, unsatisfactory. A change in the officers and employees occurred again after the Charter went into effect; many of them were new to their duties also, but they all have endeavored to carry on the work of the Hospital and are daily improving in efficiency.

The monthly reports rendered for the past year have enumerated events of immediate importance and minor details, such as the movements of the Hospital staff and employees as recorded in the Journal, and which are on file for reference in your office.

The various and elaborate tables of medical and surgical statistics show the extent of the work done in these departments. Modern medicine and surgery demand many new additions in medicines, instruments and surgical supplies. It has been a source of regret that this Hospital has not been able to fully furnish these necessities, still a steady advance for the better has been made in this respect, and an earnest effort will be made in the future to keep abreast with the times. This will not be so difficult when the New City and County

Hospital is completed, but with the present structure it is almost impossible to accomplish satisfactory results.

With regard to the maintenance of the Hospital, I beg to state that although the first part of the year was marked by considerable confusion, owing to divided authority and changes of administration, the last six months under the Charter show a great improvement in accuracy and economy. Whereas, in former years there was a deficiency in the fund annually appropriated for maintenance, I am pleased to state that the end of the fiscal year shows a creditable surplus.

The Hospital buildings need many repairs; their aspect is gloomy and condition unsanitary. I would therefore recommend that they be repainted externally and internally. Were it certain that the new Hospital would shortly be completed. I would not make this suggestion. I would, however, respectfully recommend that all the wards be thoroughly disinfected.

The Training School for Nurses still continues to be of much service. The number of pupils has somewhat increased over previous years, but there are none too many. (See Report of Principal of Training School.)

The outlook for the future, under the Charter, is cheering. While the details of the work are more exacting than formerly, the new system of contracts for all supplies will enable your Superintendent Physician to give a more economical and satisfactory administration.

Respectfully submitted,

G. E. SUSSDORFF, M. D., Superintendent Physician.

YEARLY SUMMARY.

SHOWING NUMBER OF PATIENTS ADMITTED, NUMBER BORN, NUMBER DIS-CHARGED, NUMBER DIED AND DAILY AVERAGE FOR 26 YEARS.

REPORT OF COMMISSARY.

SAN FRANCISCO, July 1, 1900.

To G. E. Sussdorff, M.D., Superintendent Physician-

Dear Sir: I herwith submit the report of the Commissary's Department of this institution for the fiscal year ending June 30, 1900.

The position of Commissary to the City and County Hospital was created at the time the New Charter took effect. Prior to the 8th day of January, 1900, a Steward performed the duties of this position. I have transcribed from the records of this former official the figures shown on the within table from June 30, 1899, to January 8, 1900. There are many glaring inaccuracies, but, having no authority to change the records, I have reported the figures as they appear on the books. The total amount of errors, as found by the experts representing the Board of Supervisors and Board of Health, aggregate \$2,932.66. Since the 8th day of January, 1900, the books have been accurately kept, and no trouble experienced.

Respectfully,

JOSEPH W. MAGUIRE, Commissary, City and County Hospitai.

REPORT OF APOTHECARY.

SAN FRANCISCO, July 1, 1900

To G. E. Sussdorff, M.D., Superintendent Physician -

Dear Sir: I herewith submit the report of the Drug Department for the fiscal year ending June 30, 1900. In reference thereto I would respectfully call your attention to the fact that under the New Charter a material saving in this department should be effected in the coming fiscal year. Acting under your instructions, strict economy in the details of this department prevails. Very respectfully,

WM. M. STANTON,

Apothecary.

REPORT OF MATRON.

SAN FRANCISCO, July 1, 1900

To G. E. Sussdorff, M.D., Superintendent Physician-

Dear Sir: I herewith submit my report, ending with the fiscal year June 30, 1900. During the year the following ladies and others have donated various kinds of clothing of excellent quality, as well as much needed old linen, which has been distributed under the order of Miss Mary Patton, the Superintendent of Training School for Nurses: Mrs. Buckingham, Mrs. J. H. Jewell, Mrs. Bates, and ladies of the California Club, Hotel Berkshire, Hotel Richelieu and from four unknown sources.

Respectfully,

MARY E. BLACK, Matron.

REPORT OF SAN FRANCISCO TRAINING SCHOOL FOR NURSES.

SAN FRANCISCO, July 1, 1900.

To G. E. Sussdorff, M.D., Superintendent Physician-

Sir: I have the honor to submit the fellowing report of the San Francisco Training School for Nurses, for the year ending June 30, 1900. There are on duty to-day:

Graduate nurses Senior pupil nurses Junior pupil nurses Probationers	2 14 12 8
Total	36
Probationers received during the year Probationers accepted	39 16
Probationers rejected Probationers withdrawn	10 5
Monthly average of pupil nurses on roll	25 8 80

GRADUATES OF THE CLASS OF 1899-1900 (18.)

Bloomfield, Rose.
Clements, Elenor.
Craighan, Lily Augusta.
Cussen, M. G.
Keefe, Annie.
Koppitz, Elenor.
Lincoln, Annie.
McPike, Minerva.
McLaughlin, Annie.

McQueen, Jessie.
O'Donnell, Agnes.
Rowley, Julia A.
Sullivan, Margaret.
Stewart, Laura B.
Tilden, Elizabeth.
Wever, M. E
Woolley, Agnes M.
Wilson, Josephine.

The lectures given were eight on eye, ear and throat, by Dr. Hugh Lagan; ten on surgical nursing, six by Dr. Terry and four by Dr. Emmet Rixford; twelve on medical nursing, by Dr. Wilson Shiels; five on obstetrics, by Dr. James F. McCone; three on bacteriology, by Dr. Wm. Ophiils; twelve on physiology and anatomy, by Dr. W. W. Wymore; four on anatomy, by Dr. T. D. Maher. In the absence of Dr. Kerr, six lectures on hospital construction, hygienic conditions of cities, towns and villages, arrangement and building of houses, ventilation. etc., were given by Dr. Wilson Shiels.

We are indebted to the medical and surgical hospital staff for the care and trouble they have taken in lecturing and conducting the examinations.

We also express our thanks to the Superintendent and Resident Physician and officers of the Hospital for kindness and courtesy shown.

Respectfully,

MARY PATTON, Chief Nurse,

Hay 7	acres
Pasturage 8	
Vegetables17	acres
Waste lands 2	acres
Total80	acres

LIVE STOCK.

Horses
Cows10
Calves 5
Hogs (large) 30

We have grown all the vegetables consumed by the inmates during the year on the grounds, and have every prospect of raising an excellent potato crop from the thirty acros planted with the same.

We still supply water to an adjoining milk ranch, and receive in return one can of milk daily, valued at 50 cents.

I bought six horses at a cost of 1,100—which amount was a portion of the surplus money remaining over after the first half of the fiscal year; two of said torses have been doing service for the Morgue officials since March last.

We desire to thank Mrs. Phoebe Hearst for her continued generous annual donation to institution.

Dr. Pischel generously continues his regular visits as oculist to the inmates, his services being as heretofore gratuitous.

Regular visits have heen made and many kindnesses tendered the inmates by the Rev. D. O. Kelly, the clergy of St. Dominic's and St. James' Parishes, the Salvation Army, the Catholic Ladies' Aid Society, the French Ladies' Aid Society and the German Ladies' Benevolent Society.

We desire to return thanks to the many people who have contributed their time and talent towards making our monthly entertainments for the amusement of the inmates a success.

The improvements and repairs necessary to the different buildings have not been as numerous as could be desired during the past year, as I did not deem it advisable to expend any portion of the surplus moneys standing to the credit

of the Institution, except what was absolutely necessary for the maintenance and comfort of the inmates.

Building No. 1 requires painting and new flooring laid, though we were able during the year to newly floor ten rooms and the main hall. We also repaired the skylights in main hall and three skylights in side hall, also putting new glasses to the same. The whole main floor of No. 1 building has also been painted, and the wards on the main floor of No. 2 building.

I put in a copper coffee boiler with a capacity of 100 gallons, three copper covers on stock boilers, and rearranged cooking apparatus and placed a 750-gallon compression boiler in the kitchen, also put up a new smokestack on laundry boller. We put in twenty stoves in place of grates in sick wards and office of building No. 1 and also plastered the same. I bought 75 army iron bedsteads to replace the old wooden ones which had become entirely unfit for use. We have also had made two new tip carts and two new wagon beds. I deem it very advisable that a new steel tank and frame with a capacity of 100,000 gallons be erected in place of the present structure, which is in an unsafe condition owing to the timbers of the tank frame being rotten and the joists broken.

Thanking the Honorable Board of Health and the Honorable Board of Supervisors for their kind support and co-operation. I respectfully submit this report,

E. A. REDDY,

Superintendent.

REPORT OF THE RESIDENT PHYSICIAN.

SAN FRANCISCO, July 1, 1900.

To the Honorable the Board of Health Of the City and County of San Francisco—

Gentlemen: I hereby present to your Honorable Board the yearly report of the Medical Department of the City and County Almshouse for the fiscal year ending June 30, 1900.
